

TRACER STUDIES

AN OPERATORS GUIDE TO TRACER STUDIES
AND WHAT THEY CAN TELL YOU

...YOUR SPEAKER

- Water Treatment Plant Superintendent for the City of Grants Pass
- 17 Years experience at a “semi” conventional water treatment plant

WHAT WE ARE GOING TO COVER

- Reasons to perform a tracer study
- Step Dose vs. Slug Dose
- Where and how to inject
- Where and how often to collect the data
- Processing the data
- What can be learned

REASONS FOR TRACER STUDY

- Regulatory Compliance
 - Baffling/Flocculation Changes?
 - New Basins?
- Want to change application points of disinfectants?
- Impacts of sludge blankets on basin detention times?
- Impacts of flow changes
- Validating numbers obtained in previous studies

TRACER STUDY PLAN

- If the tracer studies are being performed for compliance reasons...
 - Plan must be submitted and approved by the regulating agency.
 - Must contain:
 - What tracer element will be used
 - How it will be injected
 - What expected T10 Results
 - Sample protocol (where, why, how often)
 - How results will be calculated

STEP DOSE VS SLUG DOSE

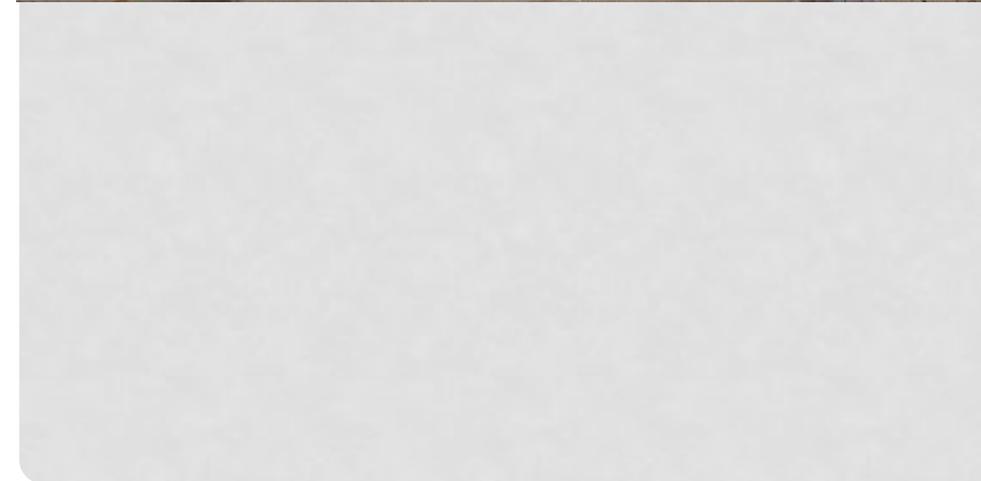

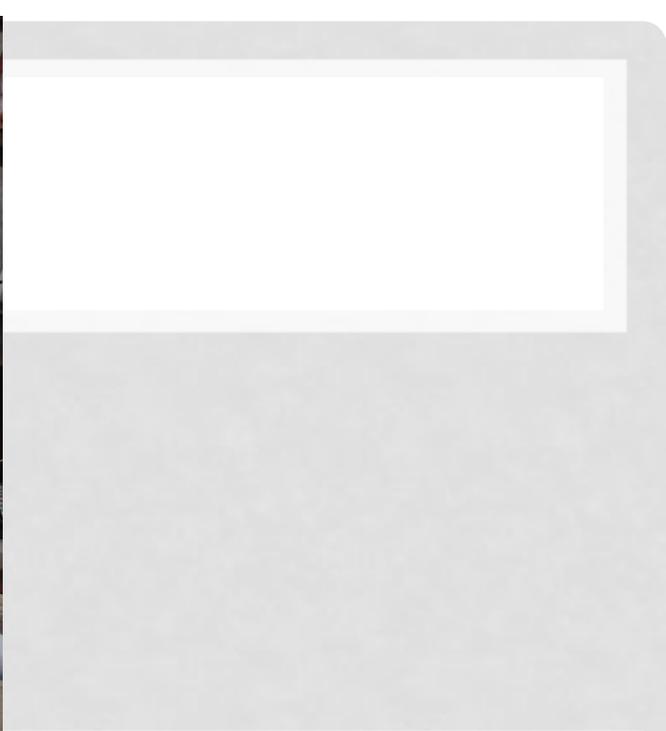

- Step Dose
 - Adjust Chemical up/down
 - Advantageous if using a chemical that is already being fed
 - Tests can be run in fairly fast succession
- Slug Dose
 - Inject a volume of chemical to illicit a change
 - Typically used if injecting a chemical that isn't used in the treatment process
 - Takes longer between tests as all of tracer element must be eliminated from process stream before next test.

TRACER ELEMENTS

- Most Common:
 - Fluoride
 - Relatively easy to measure
 - May already be added/available
 - May be some consumption in raw water applications
 - Hazardous to handle
 - Online
 - Conductivity Agents
 - Easy to measure
 - Safe to handle and feed
 - Little or no consumption in raw water applications

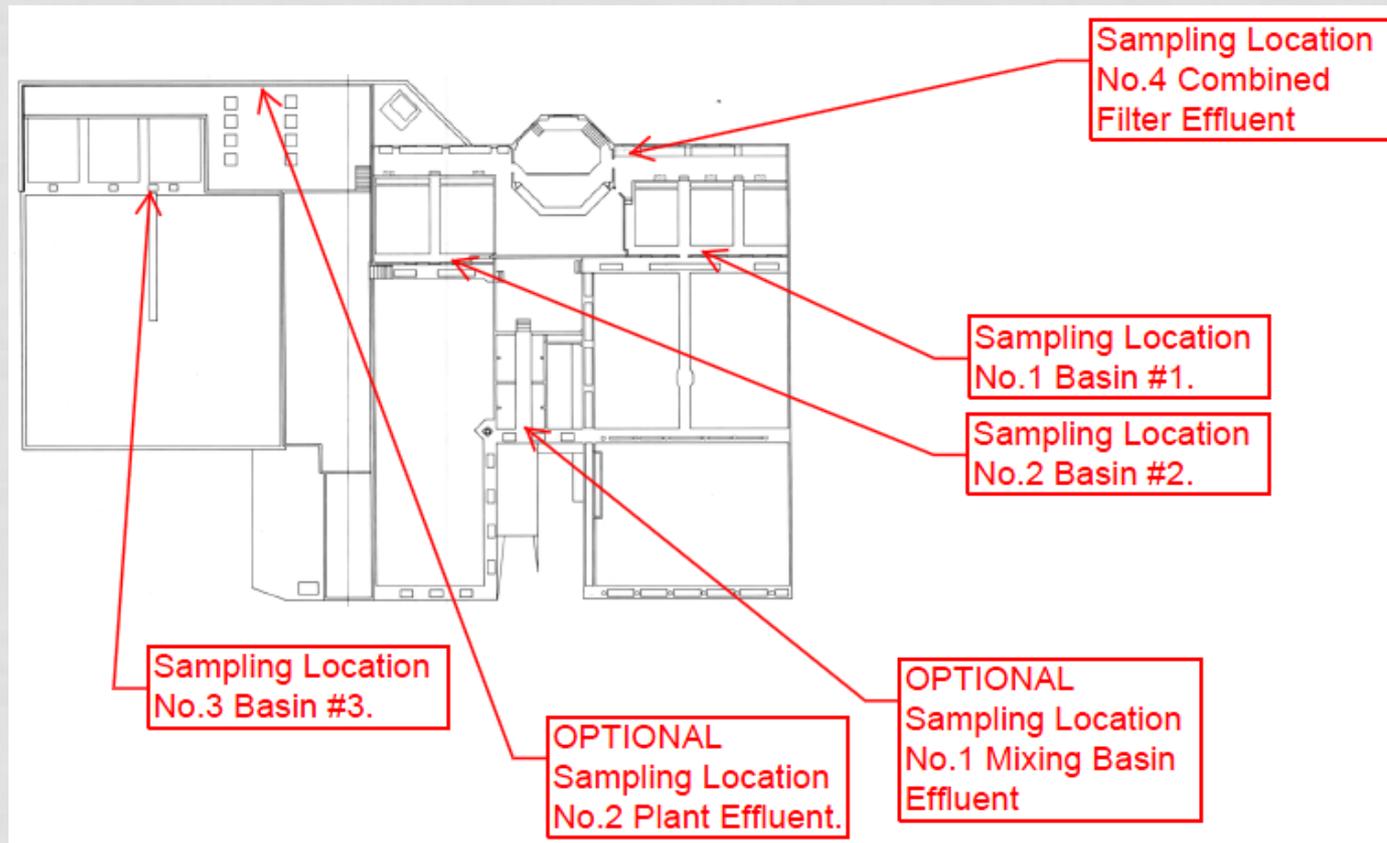

WHERE AND HOW TO INJECT

- Select locations where good mixing will be attained
 - Should mimic actual conditions as much as possible.
- Inject as fast as possible if testing for slug dose method
- Be creative
 - Simple as dumping in buckets of prepared solution
 - Complex as adding piping and valves
- This is when knowing your plant pays off!

WHERE AND HOW TO COLLECT DATA

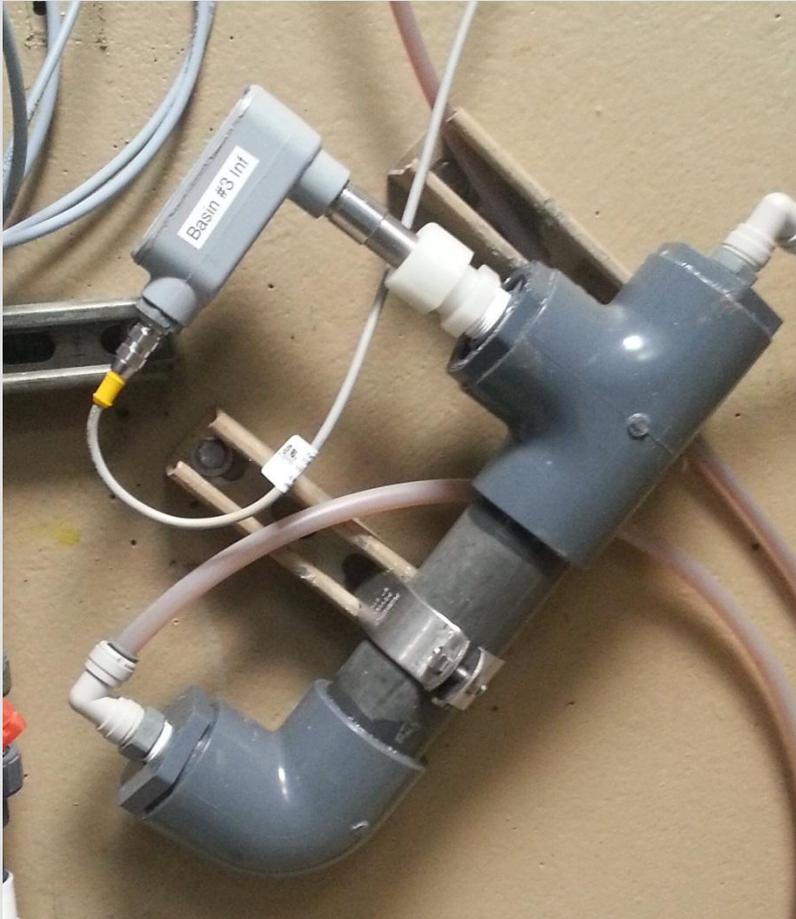

- Depends on the goals of the study
 - Monitor the end point of each unique segment

WHERE AND HOW (CONT'D)

- Think about Where you can get a sample
 - Do you have to pump? (not preferred)
 - Can you “dip” a sample
 - Can the instrument be inserted into the flow stream
- There may be a LOT of samples to process if you are analyzing samples in the lab
 - For a test expected to last 2 hours you may end up needing close to 100 sample bottles!

WHERE AND HOW

HOW MUCH DATA IS COLLECTED

- Depends on the flow rate and expected T10
- This is where automatic samplers pay off!
- Be prepared to start grabbing samples shortly after injection.
- When chemical is detected sample every minute to be able to detect the “peak”.
 - The more samples the better at this point
- After the level begins to decrease reduce sampling frequency to 3-5 minutes.
 - Sample until levels return to background levels

WHAT IT LOOKS LIKE

- This is really where the work starts...
 - Up until now it has been just fun stuff!

WHAT IT LOOKS LIKE (CONT'D)

- This is where computers make our jobs easier!
- If testing was performed in SLUG does mode it must be converted to step dose for analysis

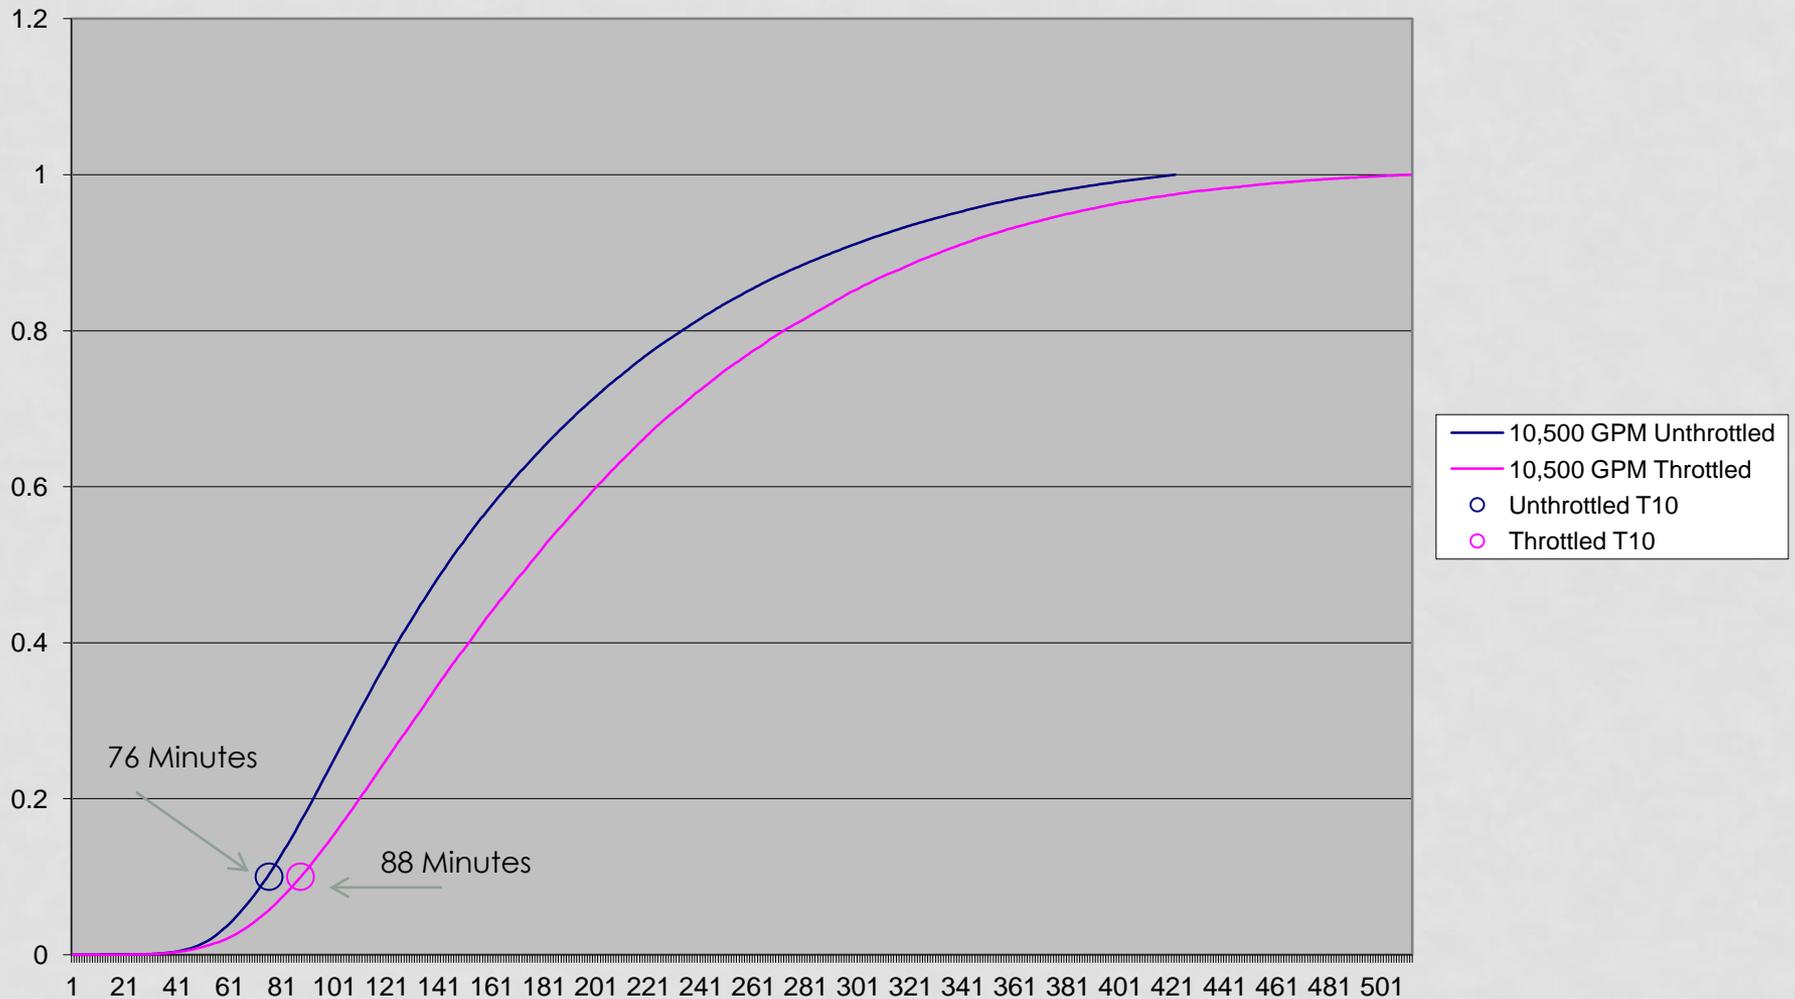

WHAT IT LOOKS LIKE (CONT'D)

EXCEL IS YOUR FRIEND

- If you can use automatic data collection through online instruments:
 - Processing the data and evaluating results takes very little time
 - Multiple tests can be performed in very short periods of time
 - Different operating conditions can be tested with little cost

WHAT THE DATA CAN TELL YOU

RE-TESTING...

- Why you may want to retest...
 - Validate test results
 - Make changes in where samples are taken, or tracer elements are injected
 - Possibility for different results based on water temperatures
 - Lesson Learned: Try to complete all your tests at a similar water temperature! Results did seem to indicate that test results changed based on raw water temperature!

LESSONS LEARNED – GRANTS PASS CASE STUDY

- Calcium Chloride
 - Easy to get and cheap to use
 - IT GETS HOT!
- Performing the tests
 - Don't let too much time lag between tests – water temperature can affect the result
 - Equalize the tracer elements temperature to raw water temp
- Analyze the data
 - CPE was actually pretty darn Close!
 - Expect surprises and anomalies

THANKS!

- Thanks to:
 - Michael McWhirter and Andrew Nishihara – MWH
 - All the staff at MSA and MWH for their help on this project!
- Questions?
