

The Benefits of AMR and Field Observations in Assessing Landscape Irrigation

Jenna Smith, CLIA

King County Housing Authority Resource Conservation Manager

Representing Seattle Public Utilities & the Saving Water Partnership

www.savingwater.org

Presentation

- Background
- Objectives
- Study Process
 - AMR
 - Field Observation
- Findings and Results

Discovery Tools

- Automatic Meter Reading
- Field Observation

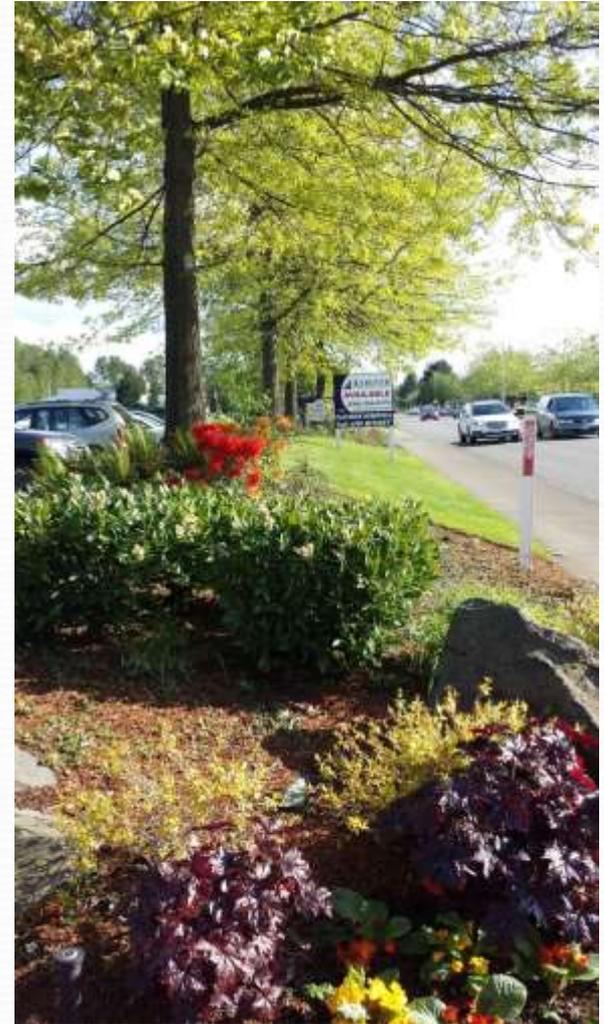

Background

Background

- 13 Years with SPU on Irrigation Efficiency Program
- Managed the Water Efficient Irrigation Program
 - Rebates
 - Technical Information
 - On-line irrigation run-time calculator
 - Market Transformation
- Worked directly
 - Landscape and Irrigation Professionals
 - Property Managers and Owners
 - Residential, Commercial, Multifamily
 - Industry groups
- Landscape Team – Utility Related Resource Conservation
 - Water
 - Solid Waste
 - Drainage
 - Water Quality

Background

- Industry change
- More customer interest in sustainability
- Efficiency strategies in the real world
- Identified good test site
 - Added benefit of AMR

Questions:

- Unknown
- Requirements
- Time
- Cost
- Issues
- Who
- Skills
- Opportunity

Objectives

- Save Water - Efficiency
- Analyze the impact of water saving strategies:
 - Technology
 - Management
- Understand how to manage efficiently while maintaining high quality landscape:
 - Fine-tuning the scheduling
 - Checking for problems

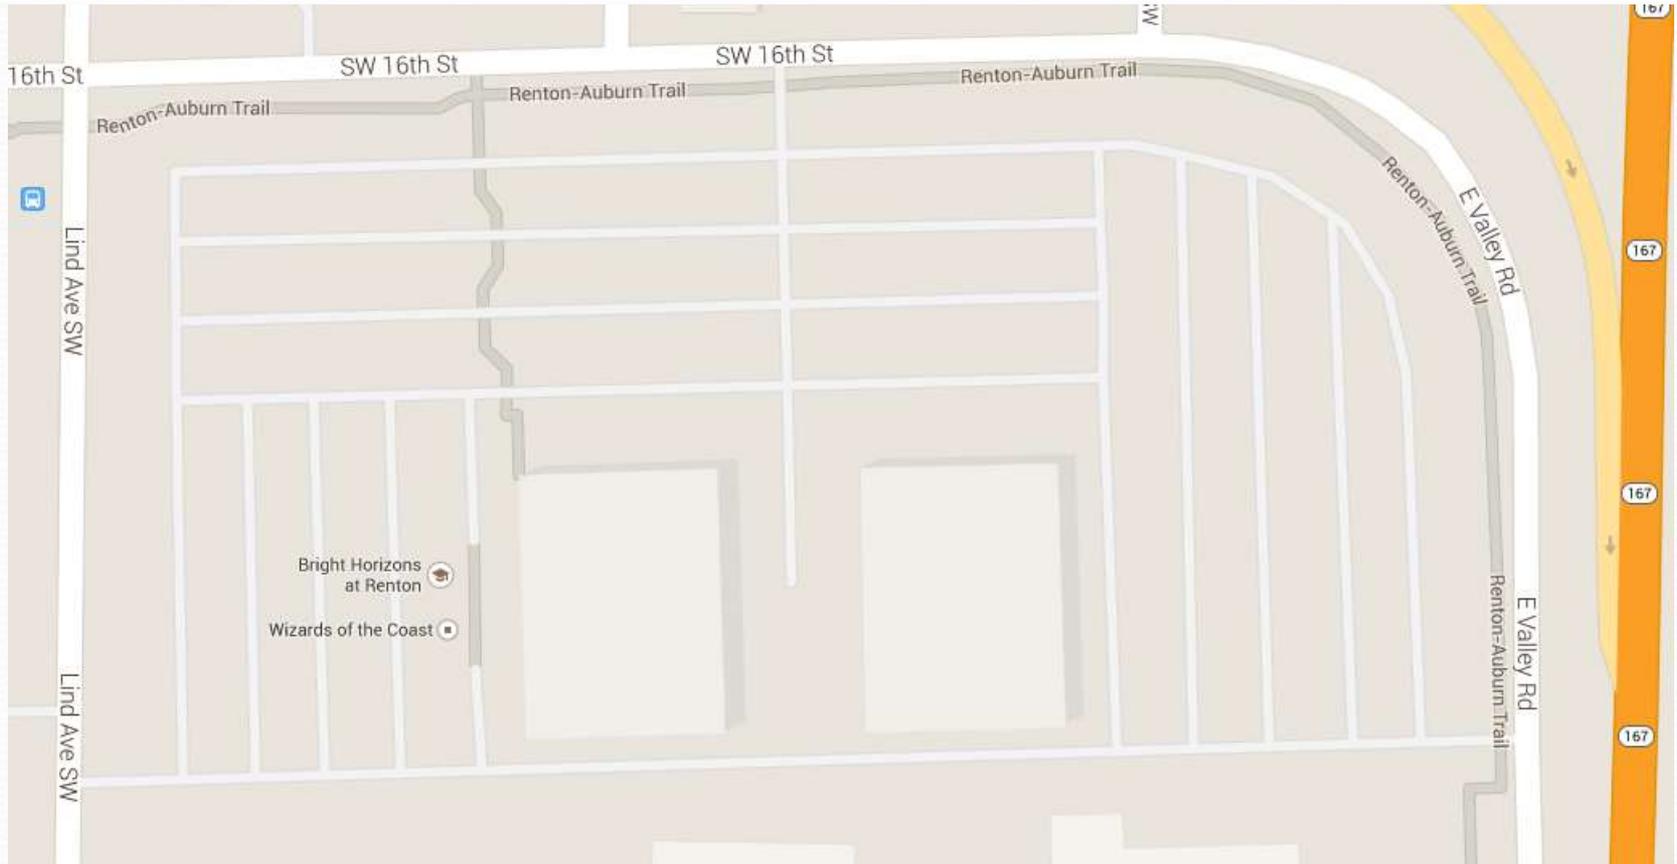

Study Process

- **Step 1: Assessment**
 - Utility bills
 - Walk-about
 - Record irrigation runtimes and frequency
 - Audit irrigation zones
- **Step 2: Implementation**
 - Change irrigation schedules
- **Step 3: Monitor & Adjust**
 - Watch and record
 - Utility data review
 - Adjust irrigation schedules
- **Step 4: Results**

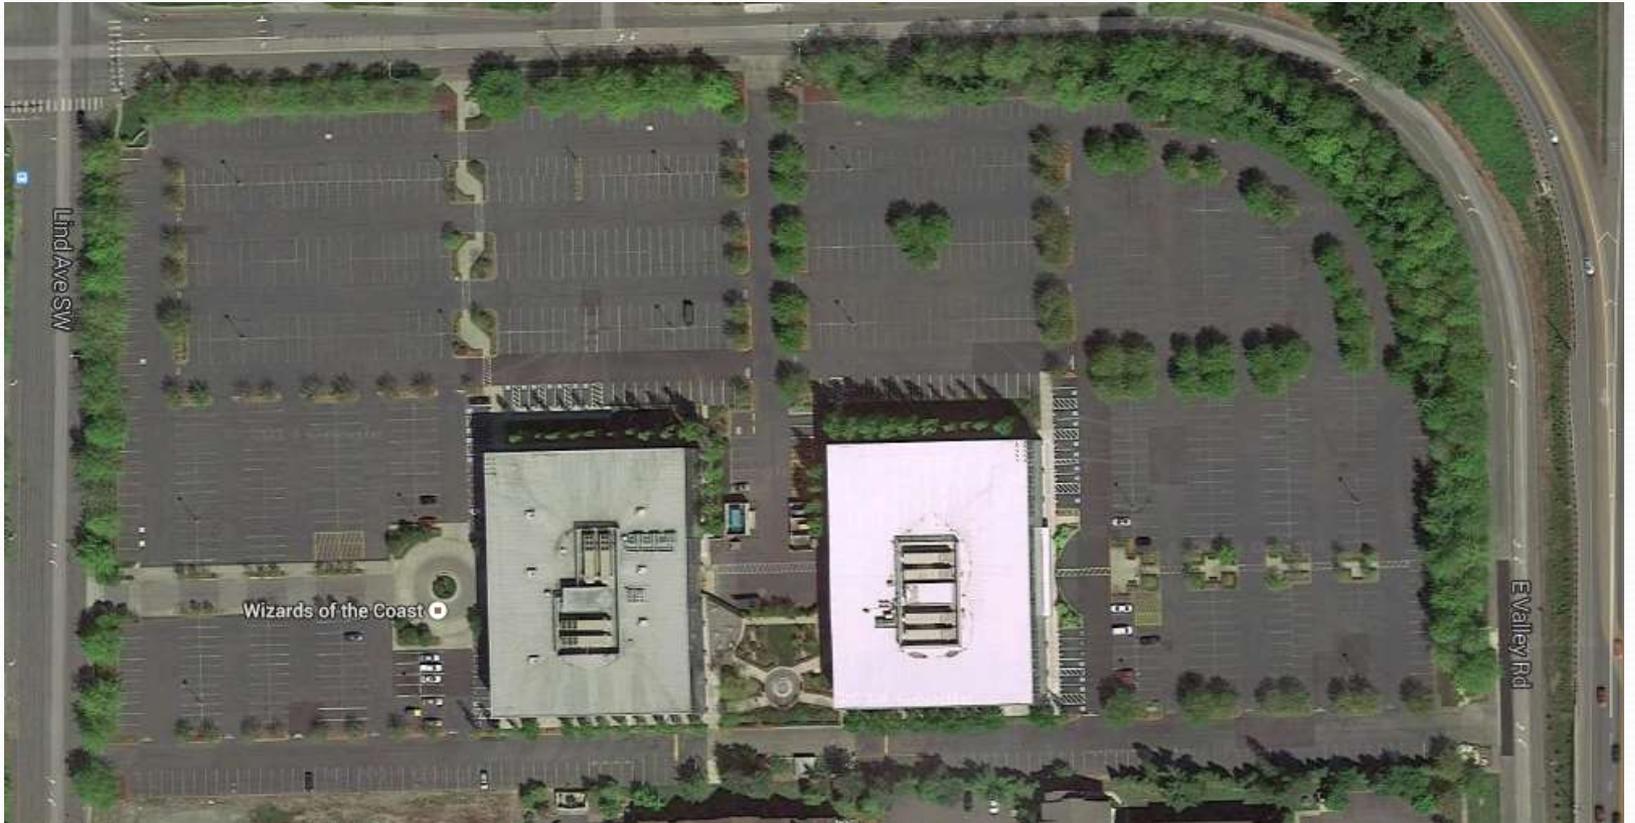

Test Site Selection

- Landmark East & West in Renton, WA
 - Good case study candidate
 - Two similar landscapes
 - Separately metered
 - Sustainability specialist
 - Real-time meter data
 - Landscape contractor

Landmark East & Landmark West

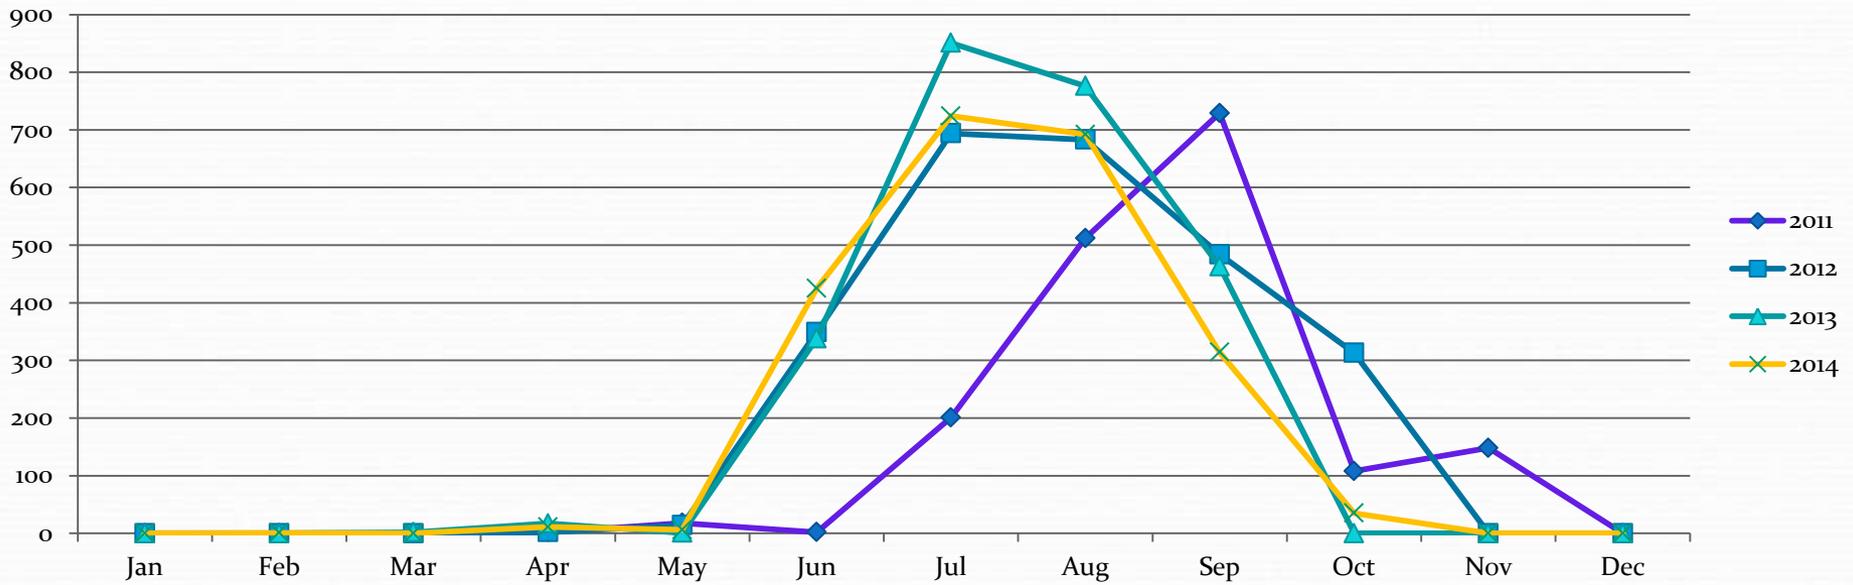

Landmark East & Landmark West

Utility Billing Information

- Multiple Years by Month

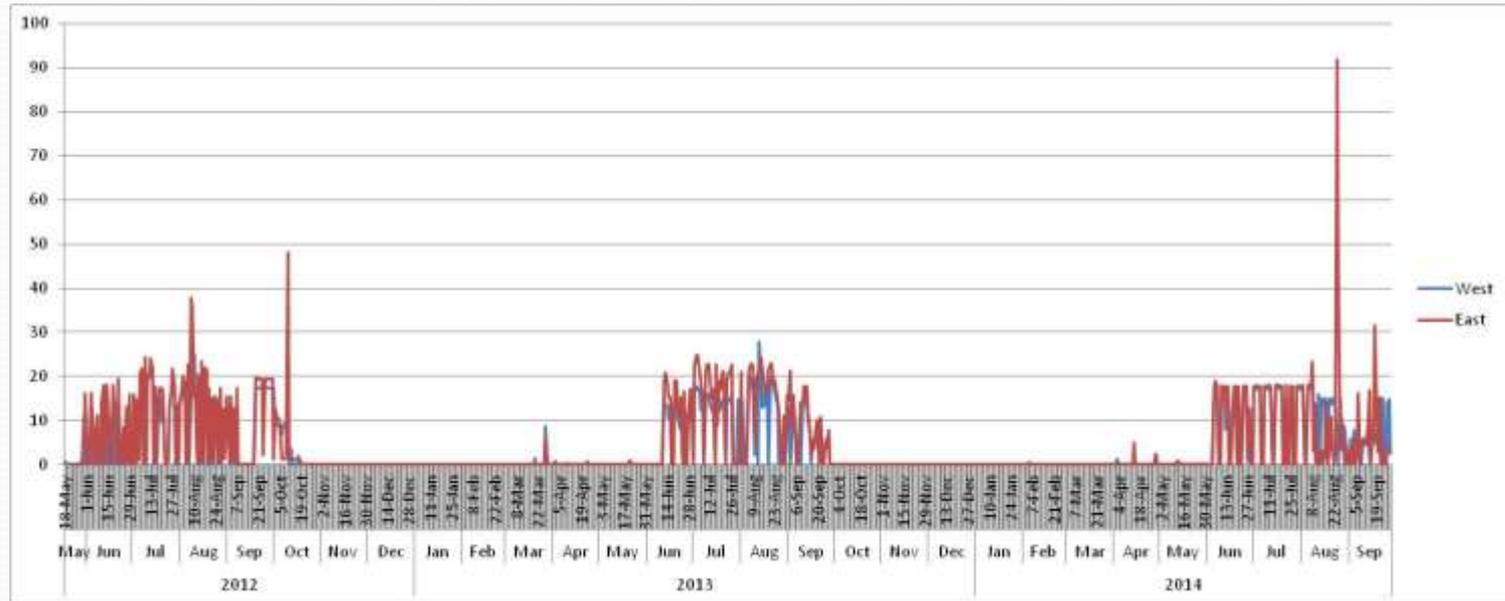

1 Unit = 1CCF or 748 gallons

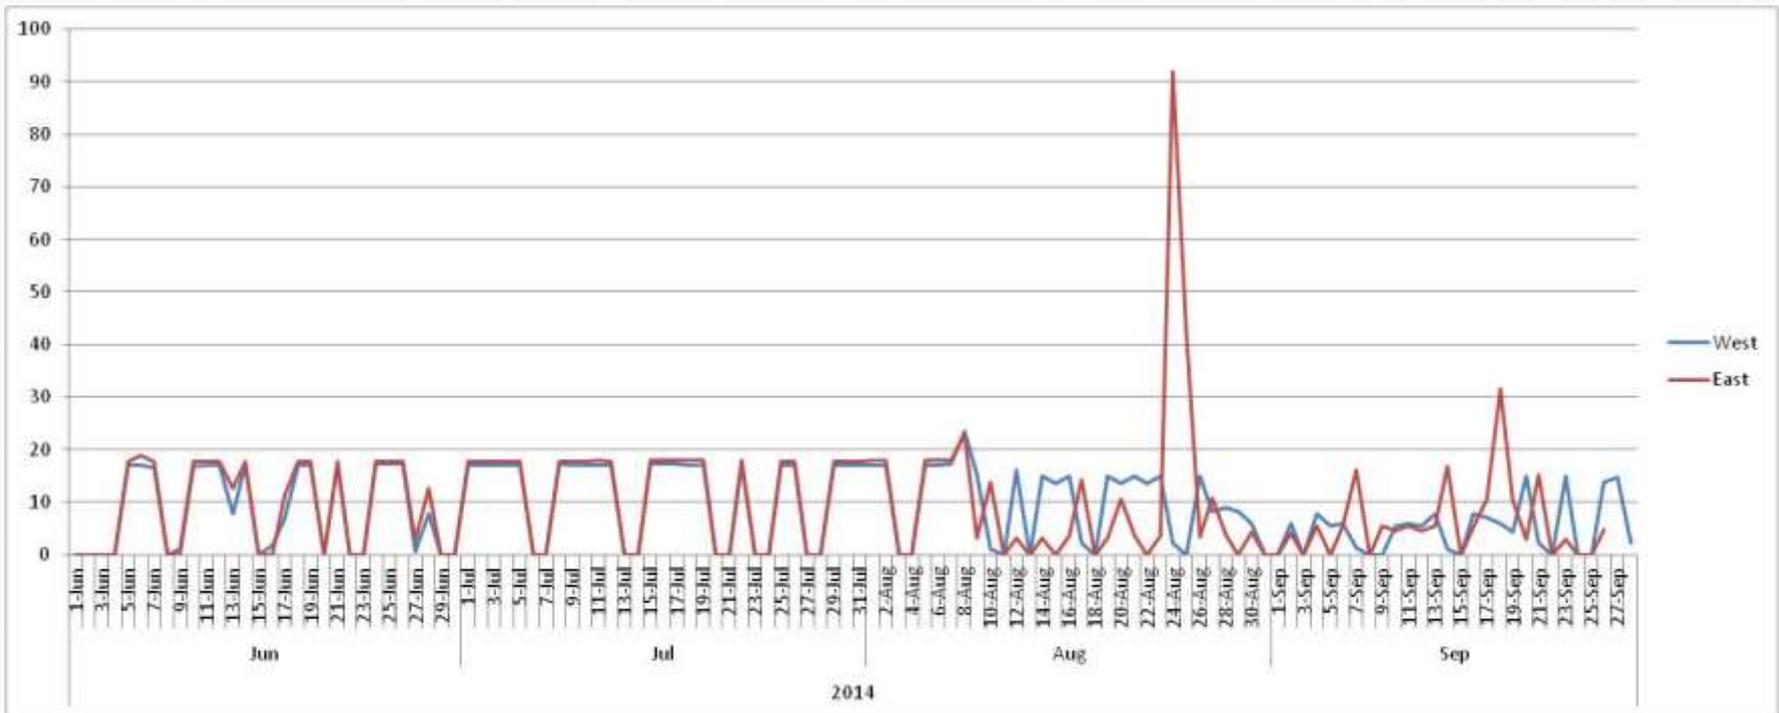

West	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Total

AMR – Years, Months, Days & Hours

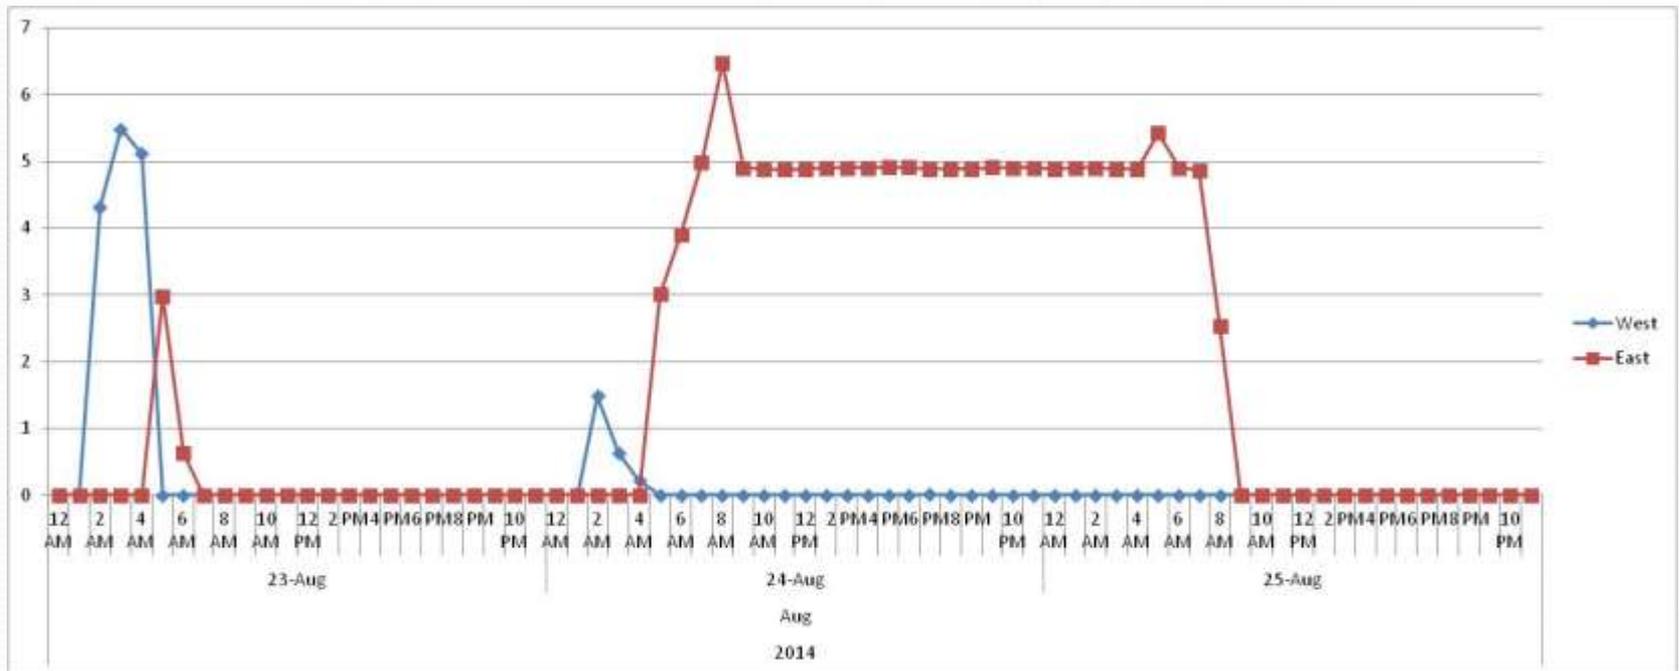

AMR – Months & Days

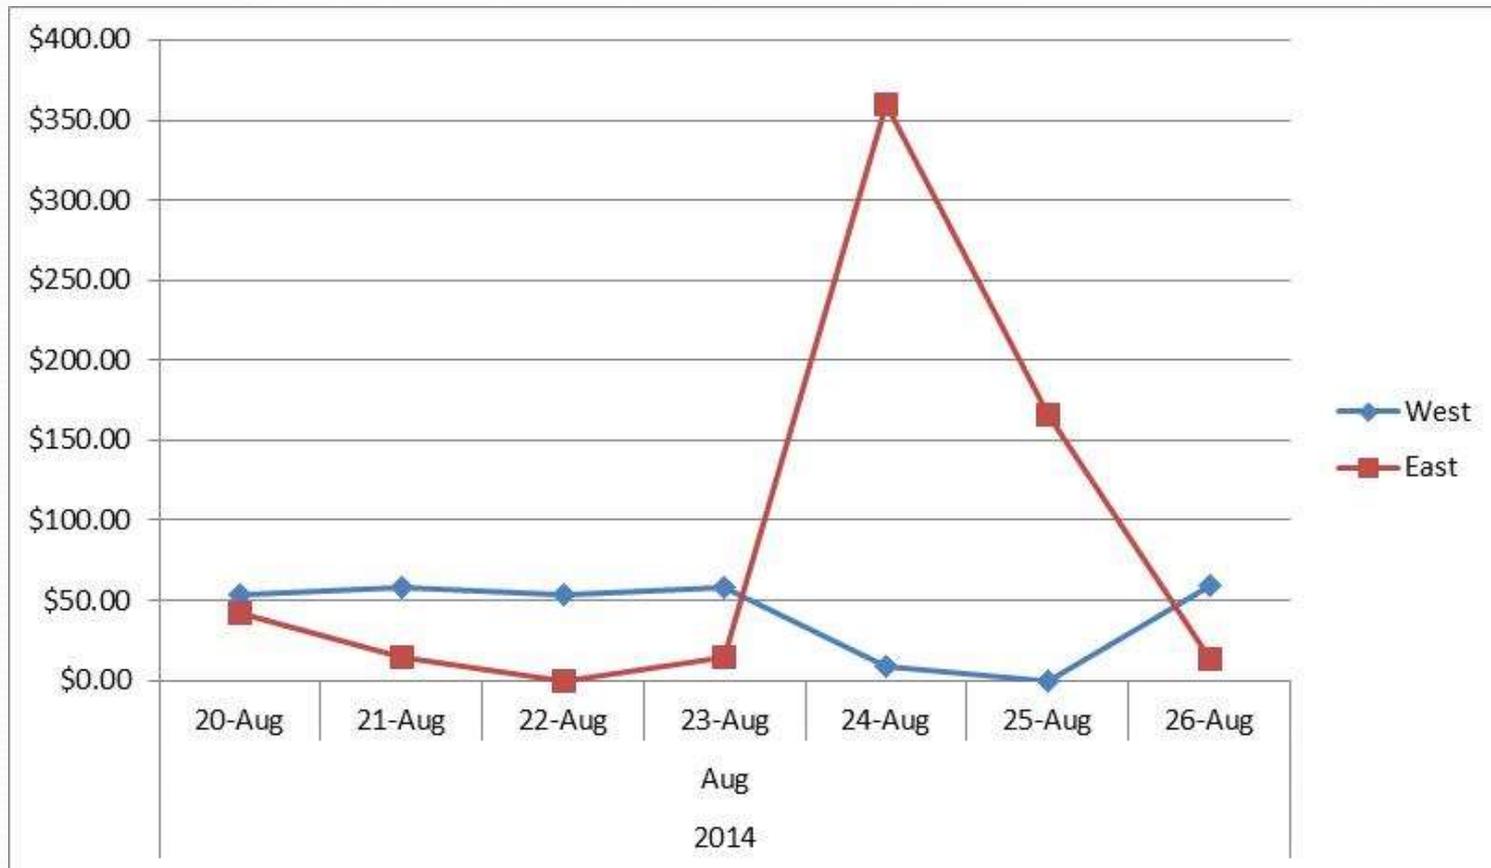

AMR – Week & Days

AMR - Hourly

AMR – Cost of the Stuck Valve

Study Process

Step 1: Assessment

- Historical water consumption
- Irrigation runtimes
- Management
- Observe
- Identify issues
- Review consumption

Historical Water Consumption

- 1 CCF or 748 gallons
- City of Renton Irrigation Water - \$3.92 per CCF
- Generally around \$8,000 per year
- Consumption patterns

Irrigation Runtimes

- Document existing schedules
- Assess use of conservation features
- Compare to standard

Hunter controller with Solar Sync (rain and weather sensor)

Irrigation Scheduling Tools

Free online tools from the Irrigation Water Management

- Sprinkler Calculators: Create custom schedules
- Daily Irrigation Index & Weekly Watering Forecast—sign up for
- Water Budget Calculator: Check your water bills

Month-by-Month Watering Schedules for the

These schedules assume there is a rain shut-off device on the

MONTH	Days per Week	LAWN- PER M	
		IRRIG. Heads	32"
May	2	26 (2 cycles of 13 mins.)	0"
June	3	26 (2 cycles of 13 mins.)	0"
July	4	26 (2 cycles of 13 mins.)	0"
Aug	4	26 (2 cycles of 13 mins.)	0"
Sept	3	26 (2 cycles of 13 mins.)	0"

* Multiple cycles or run times reduce runoff and increase the amount of water that is absorbed into the soil. If runoff continues with two run times, break the total run time into three or four cycles. Divide total minutes by number of start times to get number of minutes to program into controller.

** Or use the current Watering Forecast at www.iwms.org

*** Rotator or rotary nozzles can be retrofitted on most spray heads. These nozzles have a lower precipitation rate, which increases runtimes, and typically provide more even coverage.

MONTH	Days per Week	SHRUBS PER WATERING DAY			
		IRRIG. Heads	SPRAY Heads	ROTATOR*** Nozzles	
May	2	34 (2 cycles of 17 mins.)	14 (2 cycles of 7 mins.)	52 (2 cycles of 26 mins.)	70%
June	2	34 (2 cycles of 17 mins.)	14 (2 cycles of 7 mins.)	52 (2 cycles of 26 mins.)	80%
July	2	34 (2 cycles of 17 mins.)	14 (2 cycles of 7 mins.)	52 (2 cycles of 26 mins.)	100%
Aug	2	34 (2 cycles of 17 mins.)	14 (2 cycles of 7 mins.)	52 (2 cycles of 26 mins.)	80%
Sept	2	34 (2 cycles of 17 mins.)	14 (2 cycles of 7 mins.)	52 (2 cycles of 26 mins.)	60%

1615 weeks

Management

- Determine who is in charge of landscape and irrigation system
- Walk the site with irrigation manager
 - Wet areas
 - Broken heads

Observe

- Operate each zone for 5 minutes
 - Leaks and breaks
 - Other hardware issues
 - Document:
 - Plant material
 - Microclimate
 - Head type
 - Mulch

Step 1: Assessment

Identify Problem Areas

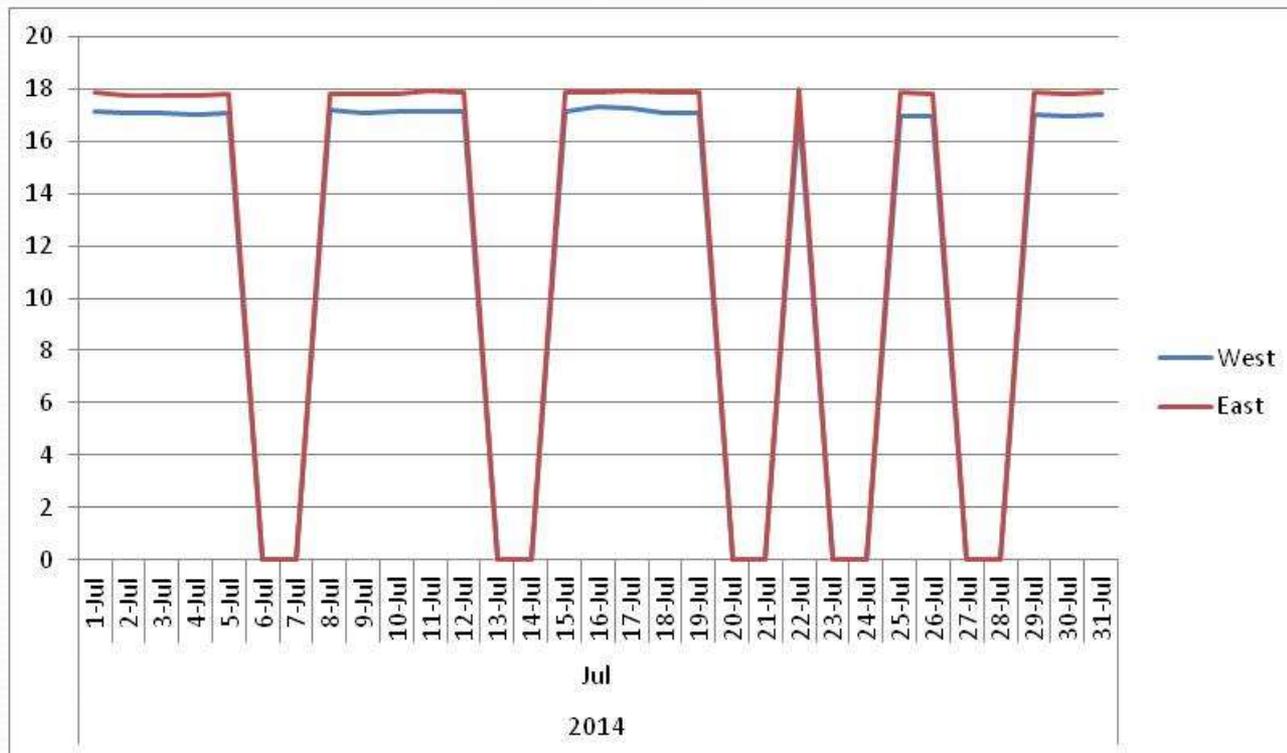

- Audit a few zones
- Compare programmed, and audited to standard schedules
- Estimate savings potential

Soil Moisture Irrigation Schedule - Spray Worksheet # 8			
Project Name		Date	
Address		Contract # & Station	
City, State			
Field Water Requirement	Value	Units	Source
A. Irrigation type	7.0	inches	Field observation
B. Performance ratio	1.0		
C. Performance (ET x CR)	7.0	inches	Weather data
D. Landscape coefficient (Kc)	0.8		$K_c = K_e \times \sqrt{A_w}$
1) Turf or lawn factor (Kc on Kc)	1.0		Shade & slope
2) Irrigation & climate factor (Kc)	0.8		Shade & slope
3) Microclimate factor (Kc)	1.0		
E. Landscape ET (ET)	5.6	inches	$ET = C \times D$
F. Average daily ET	1.4	inches	
Sprinkler Performance	Value	Units	Source
G. Precipitation rate (PR)	1.1	inches	Field observation
H. Distribution uniformity (DU)	0.8		Field observation
I. Irrigation coefficient (IC)	0.8		Field observation
Soil Moisture - Rooted	Value	Units	Source
J. Soil moisture	1.0	inches	Field observation
K. Available water (AW)	1.0	inches	Field observation
L. Root zone depth	6	inches	$A_w = L$
M. Turf available water (TAW)	6.0	inches	30% for landscape
N. Management allowable root zone (MARZ)	1.0	inches	$M = 1/3$
O. Allowable available (AA)	5.0	inches	
Soil Moisture - Unrooted	Value	Units	Source
P. Evaporation rate	0.2	inches	$E = 1/5$ (ground cover)
Q. Water in root zone	2.0	inches	$W = E \times D$ (no wind stress)
R. Lower boundary	0.5	inches	$W = E \times D$ (no wind stress)
S. Upper boundary	1.5	inches	$W = E \times D$ (no wind stress)
T. Demand from trees	1.0	inches	management decision
U. Unrooted available water (UAW)	0.5	inches	Field observation
V. Coverage factor (CF)	0.5		based on site conditions
Soil Moisture - Unrooted	Value	Units	Source
1) Soil moisture	0.5	inches	$W = E \times D$ (no wind stress)
2) Slope	0.5	inches	$W = E \times D$ (no wind stress)
3) Compaction	0.5	inches	$W = E \times D$ (no wind stress)
4) Soil type	0.5	inches	$W = E \times D$ (no wind stress)
Scheduling Boundary	Value	Units	Source
Water to be applied	2.0	inches	1.0 in 11
Number of cycles	2		1.0 in 11
Cycle starts per day	1		1.0 in 11
Number of cycles	2		1.0 in 11

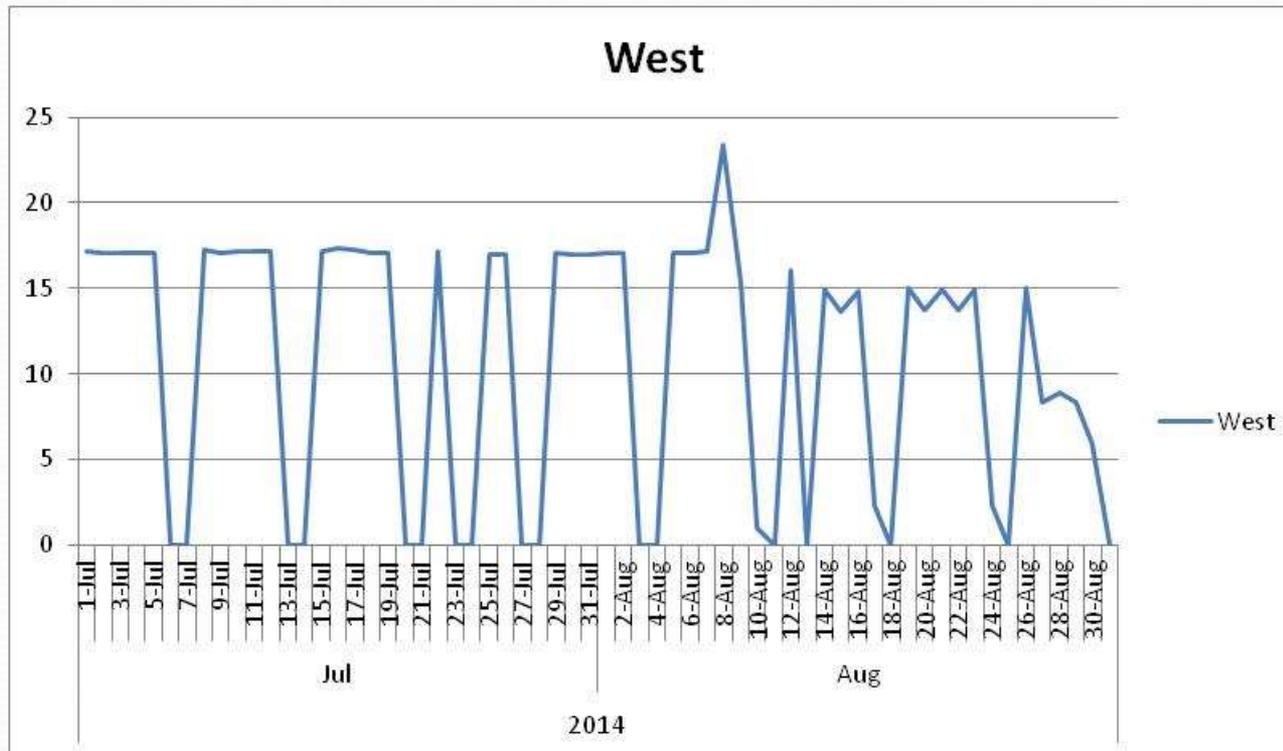

Discovery Tools

- Rain sensors working
- Weather sensors turned on but not adjusting schedules

Discovery Tools

- Solar Sync
 - Controller requires Programs to be set to specific type of sensor - Solar Sync

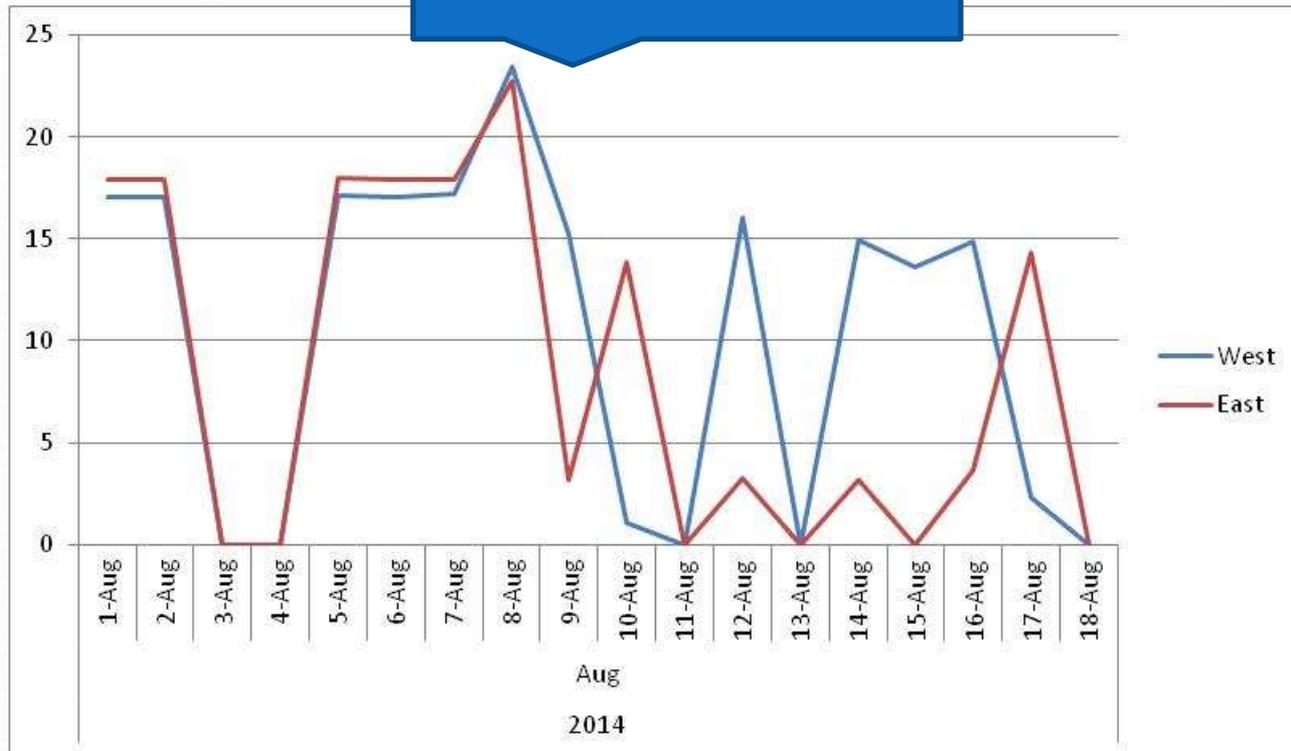

Step 2 – Implementation

Changed irrigation schedules

- East side:
 - Changed all schedules to standard
 - Turned on weather sensors and set for Seattle area climate (Solar Sync)
- West side:
 - Changed one zone that was audited
 - Turned on historical weather setting

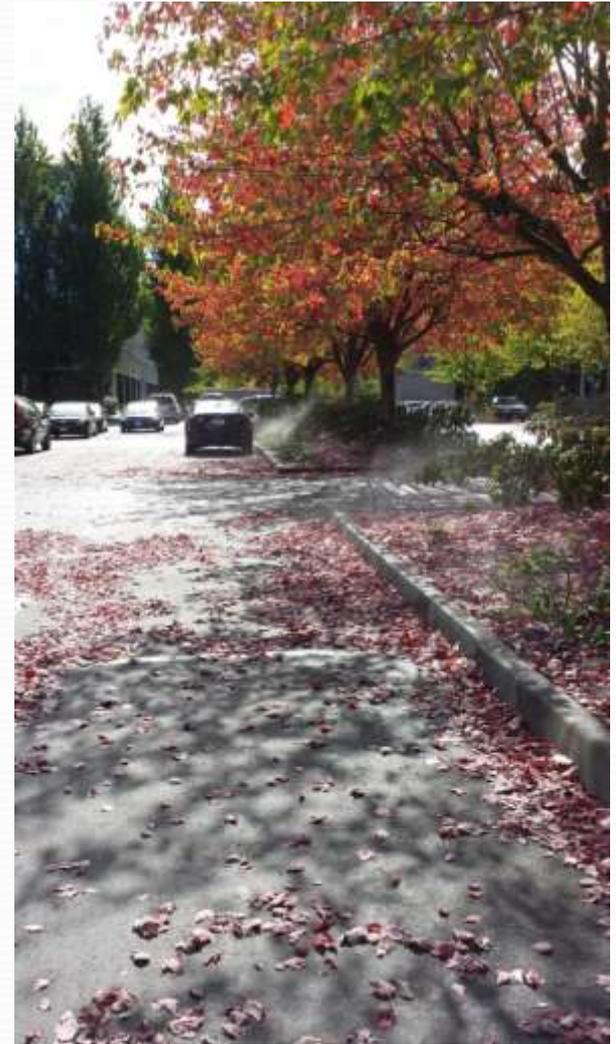

New Irrigation Schedules

- Red – New schedules and Turned on Weather Sensor
- Blue-Turned on Weather Sensor

Step 3 – Monitor and Adjust

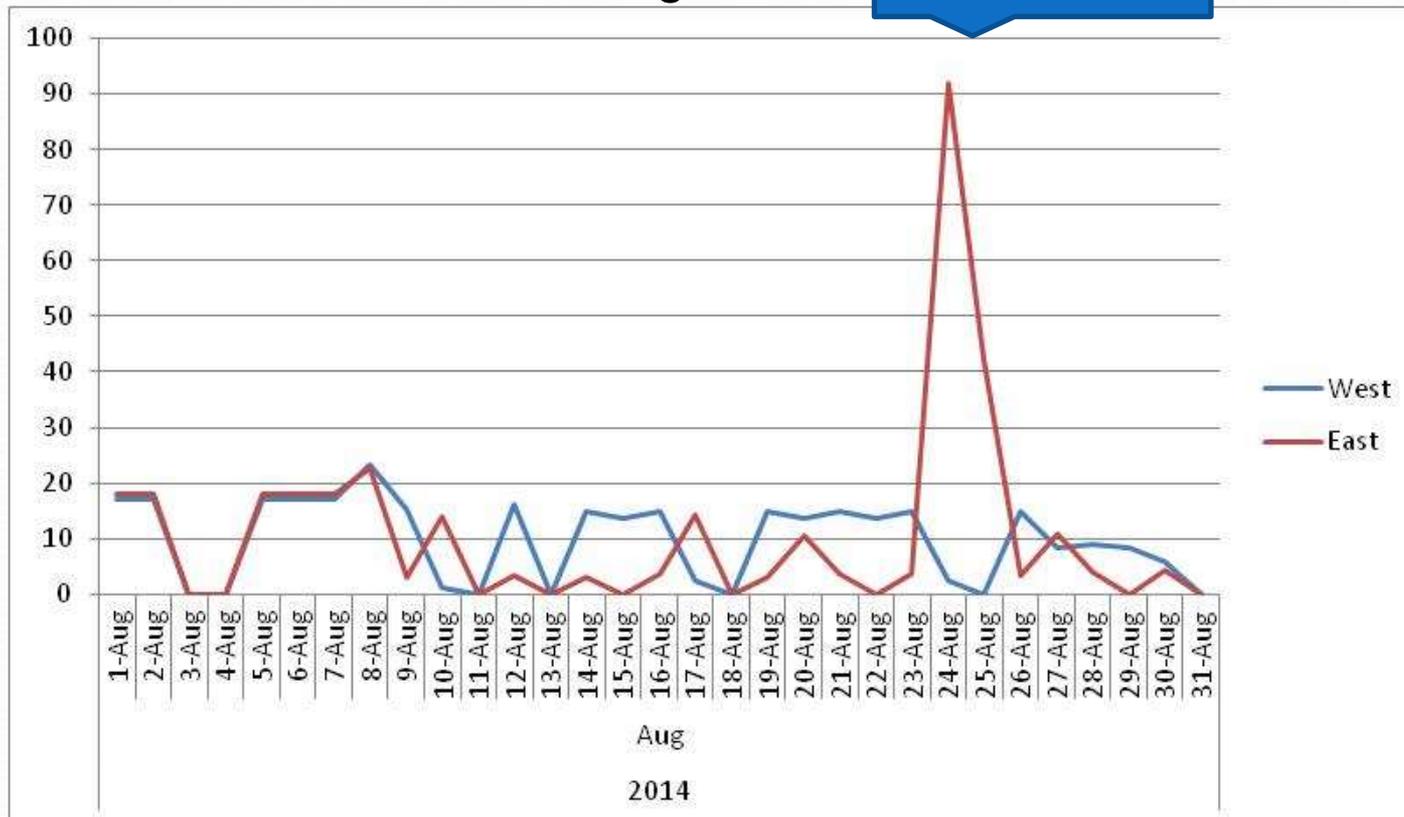

- Visit site weekly
- Monitor consumption with AMR
- Adjust irrigation schedules

AMR Insights

- Stuck valve
- Weather sensor still not working

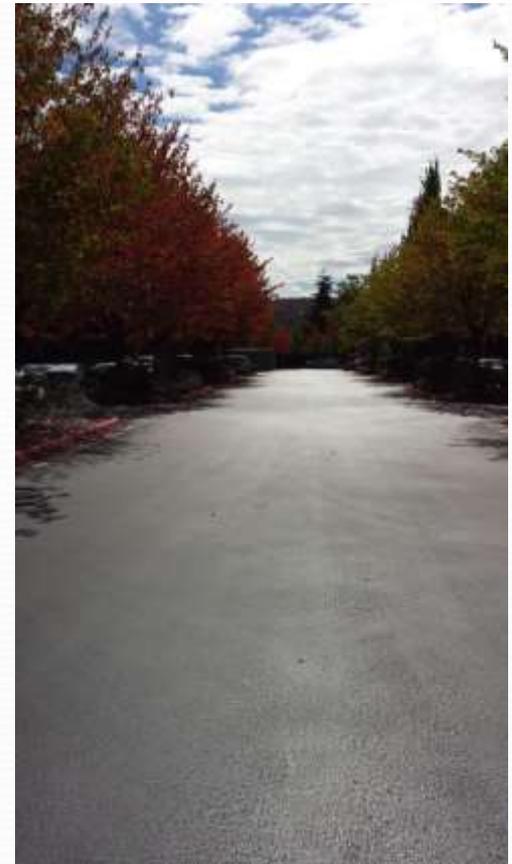

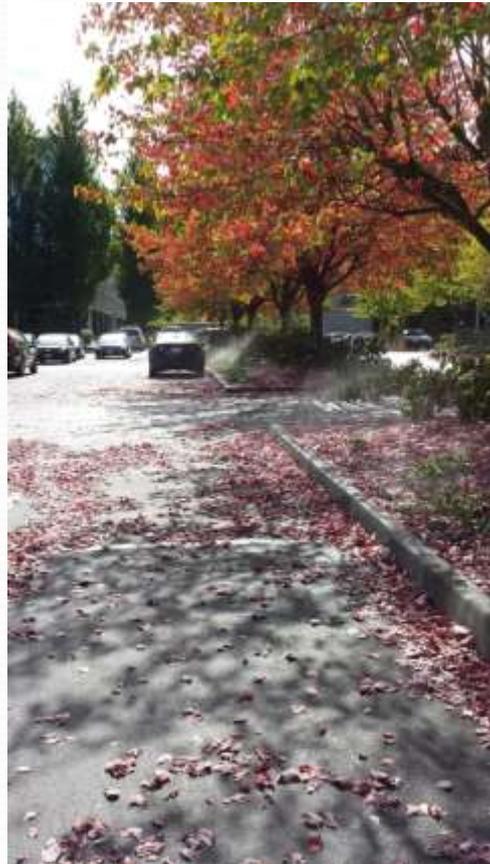

Stuck valve

Turf – Looks okay but not perfect

September 19, 2015

September 25, 2015

1.5 inches of rain

Step 3: Monitoring

Adjust Irrigation Runtimes

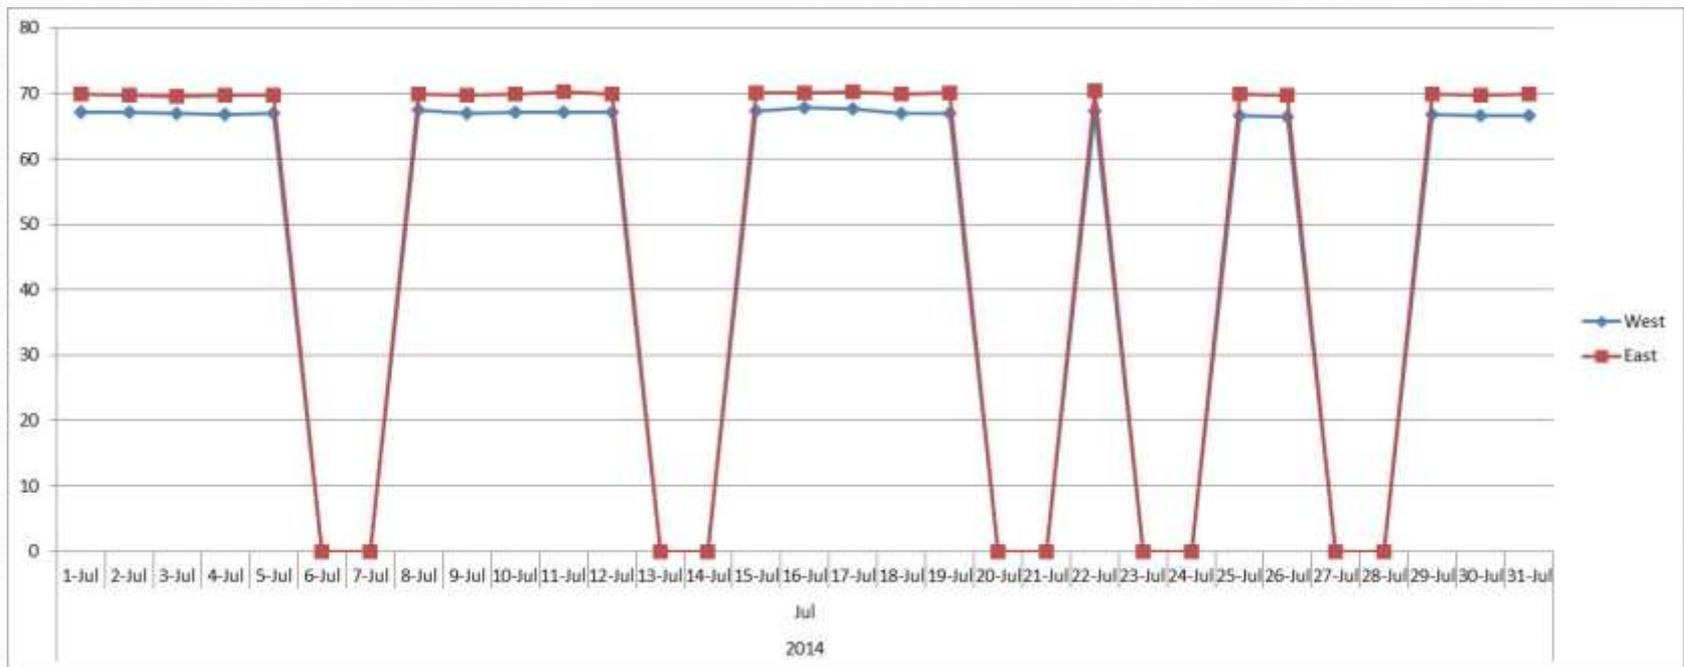

- Utilized irrigation auditing to adjust runtimes on turf areas
- Utilized irrigation auditing forms to adjust beds

Step 4 – Results:

- Identify major issues affecting irrigation
- Program controllers for 2015
- Estimate savings

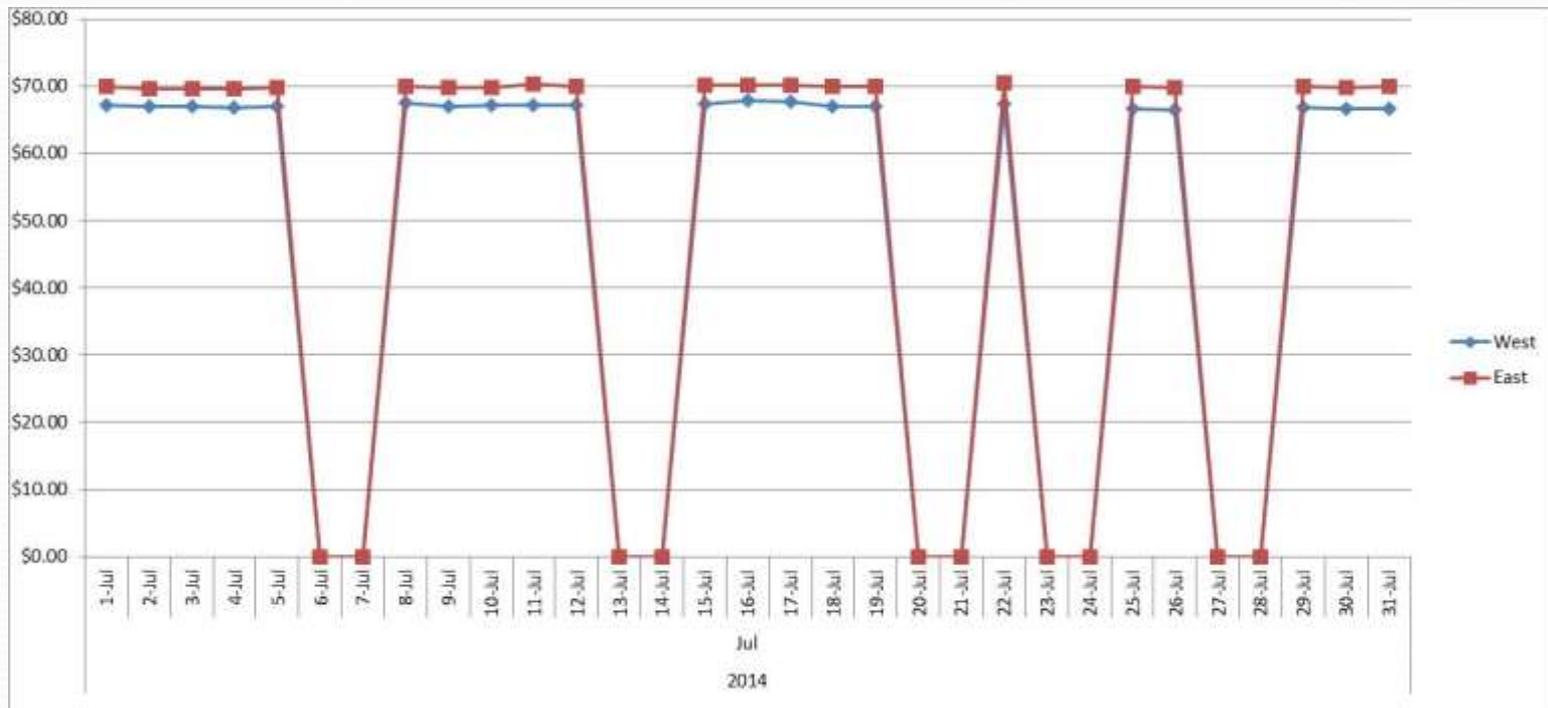

Bottom-line: Rain Sensors

- Rain sensors work

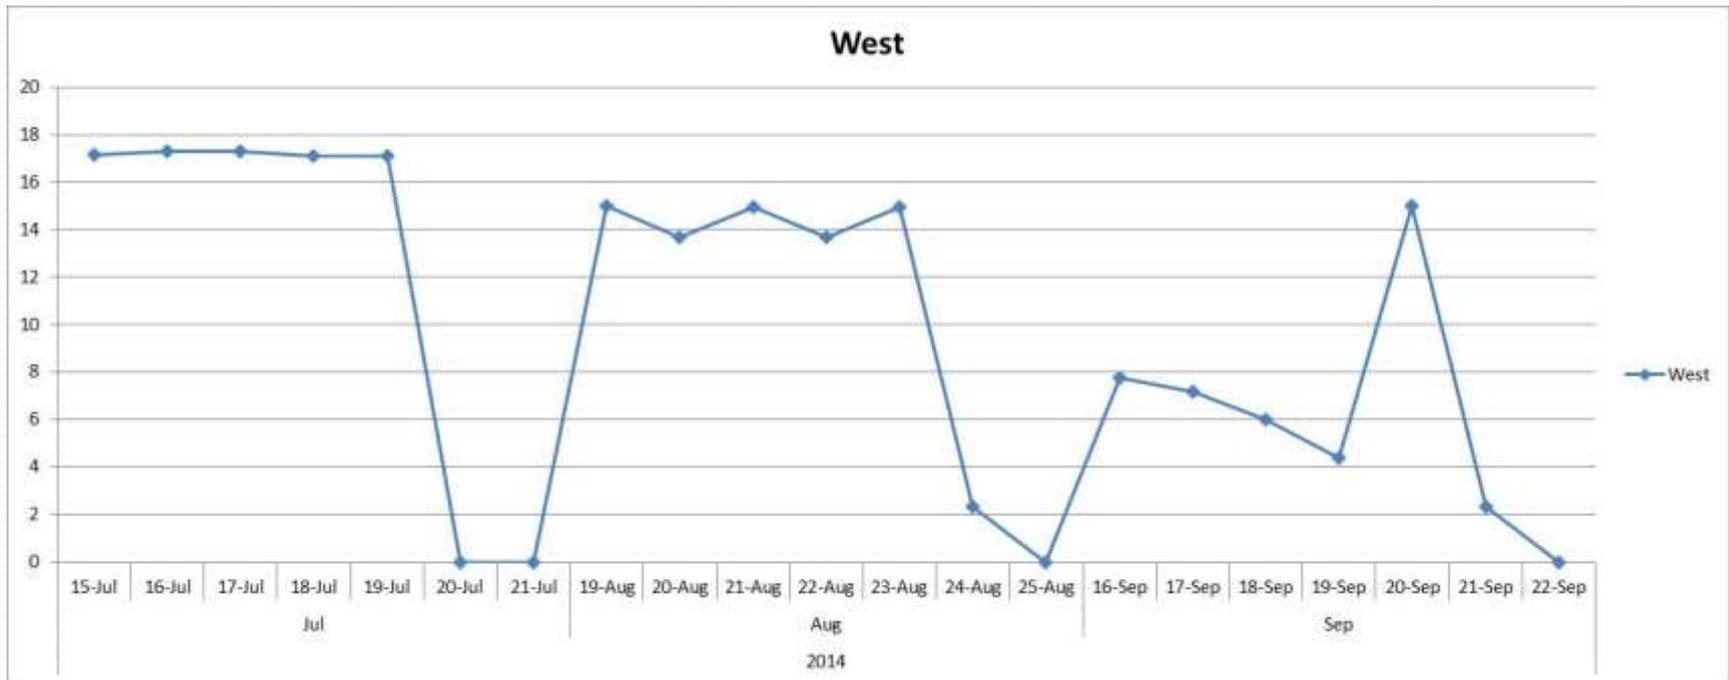

Bottom-line: Rain Sensors

- Rain sensors saving money

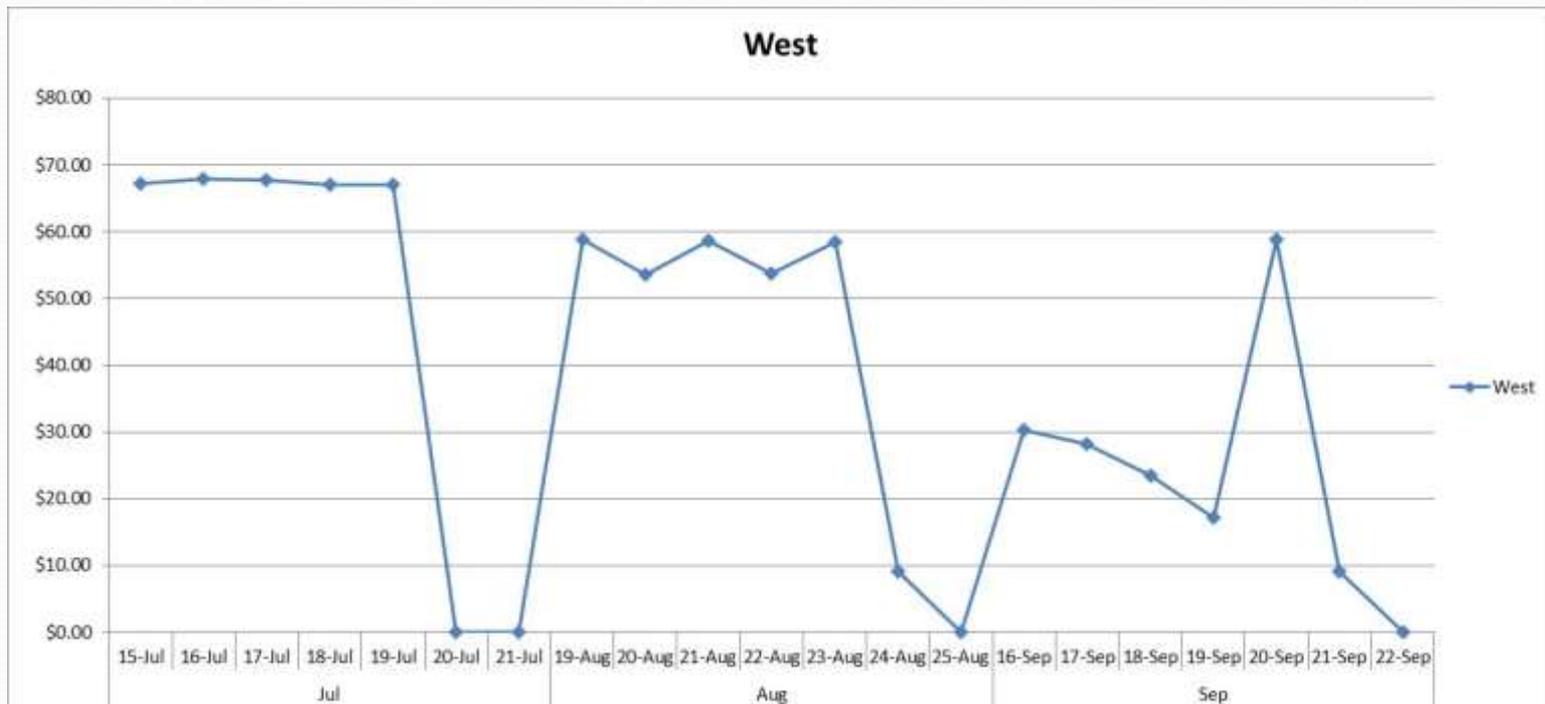

Bottom-line: Weather Sensors

- Weather sensors work – Weekly comparison

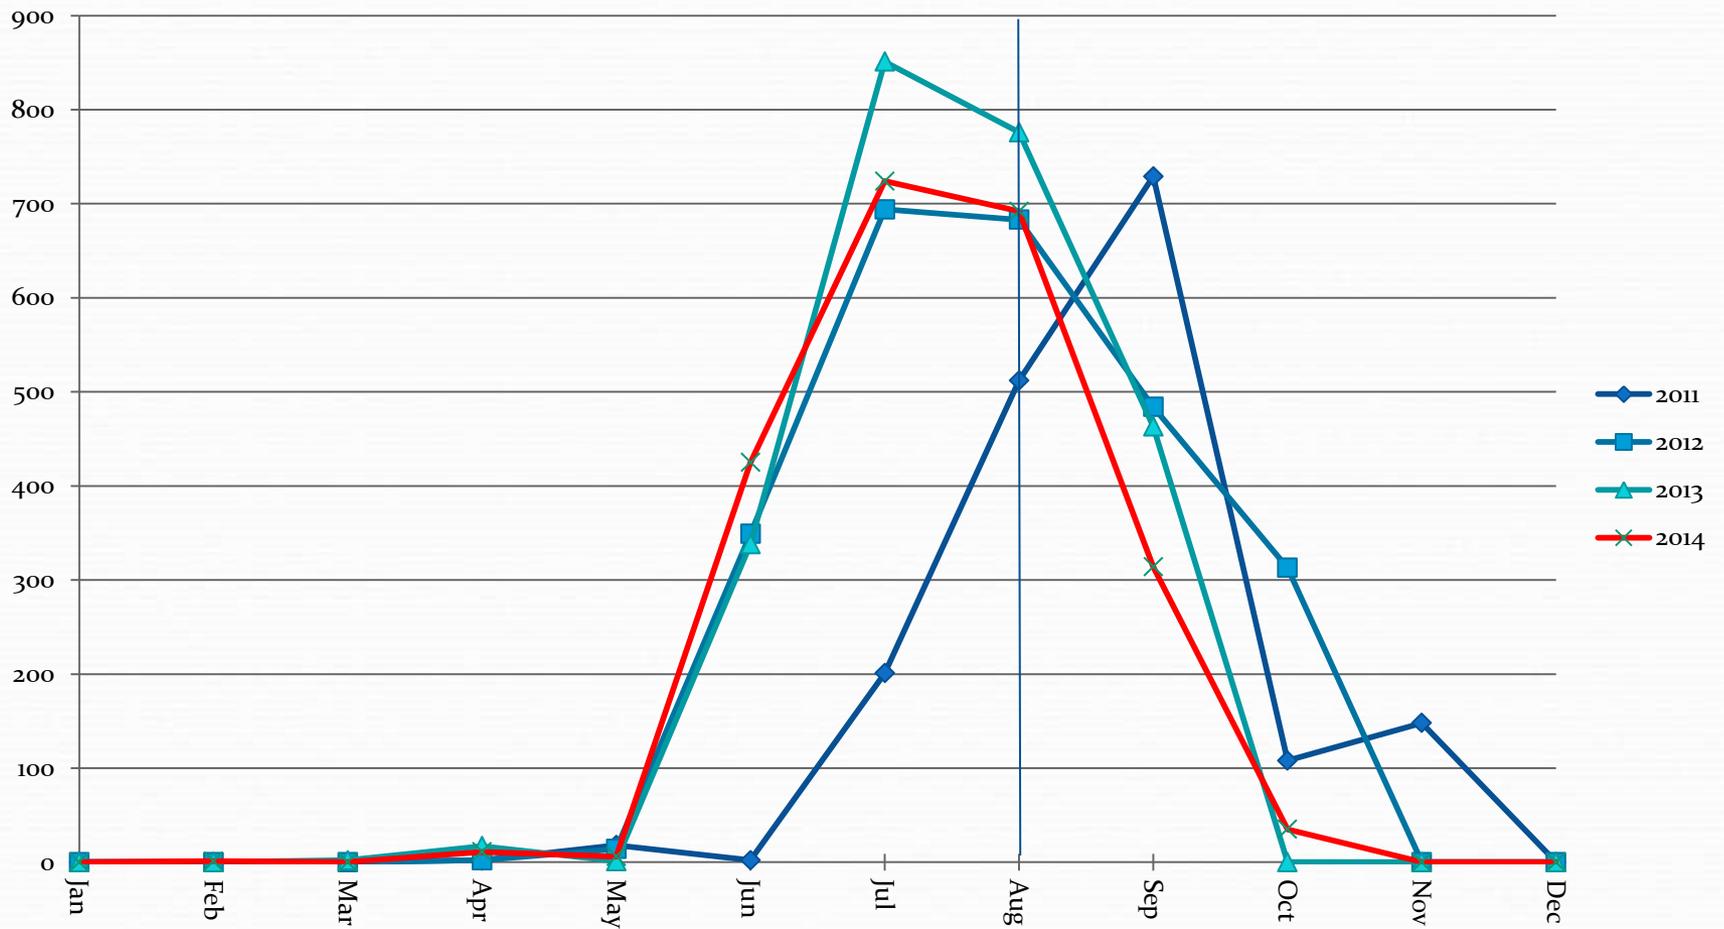

Bottom-line: Weather Sensors

- Weather sensors save money – Weekly comparison

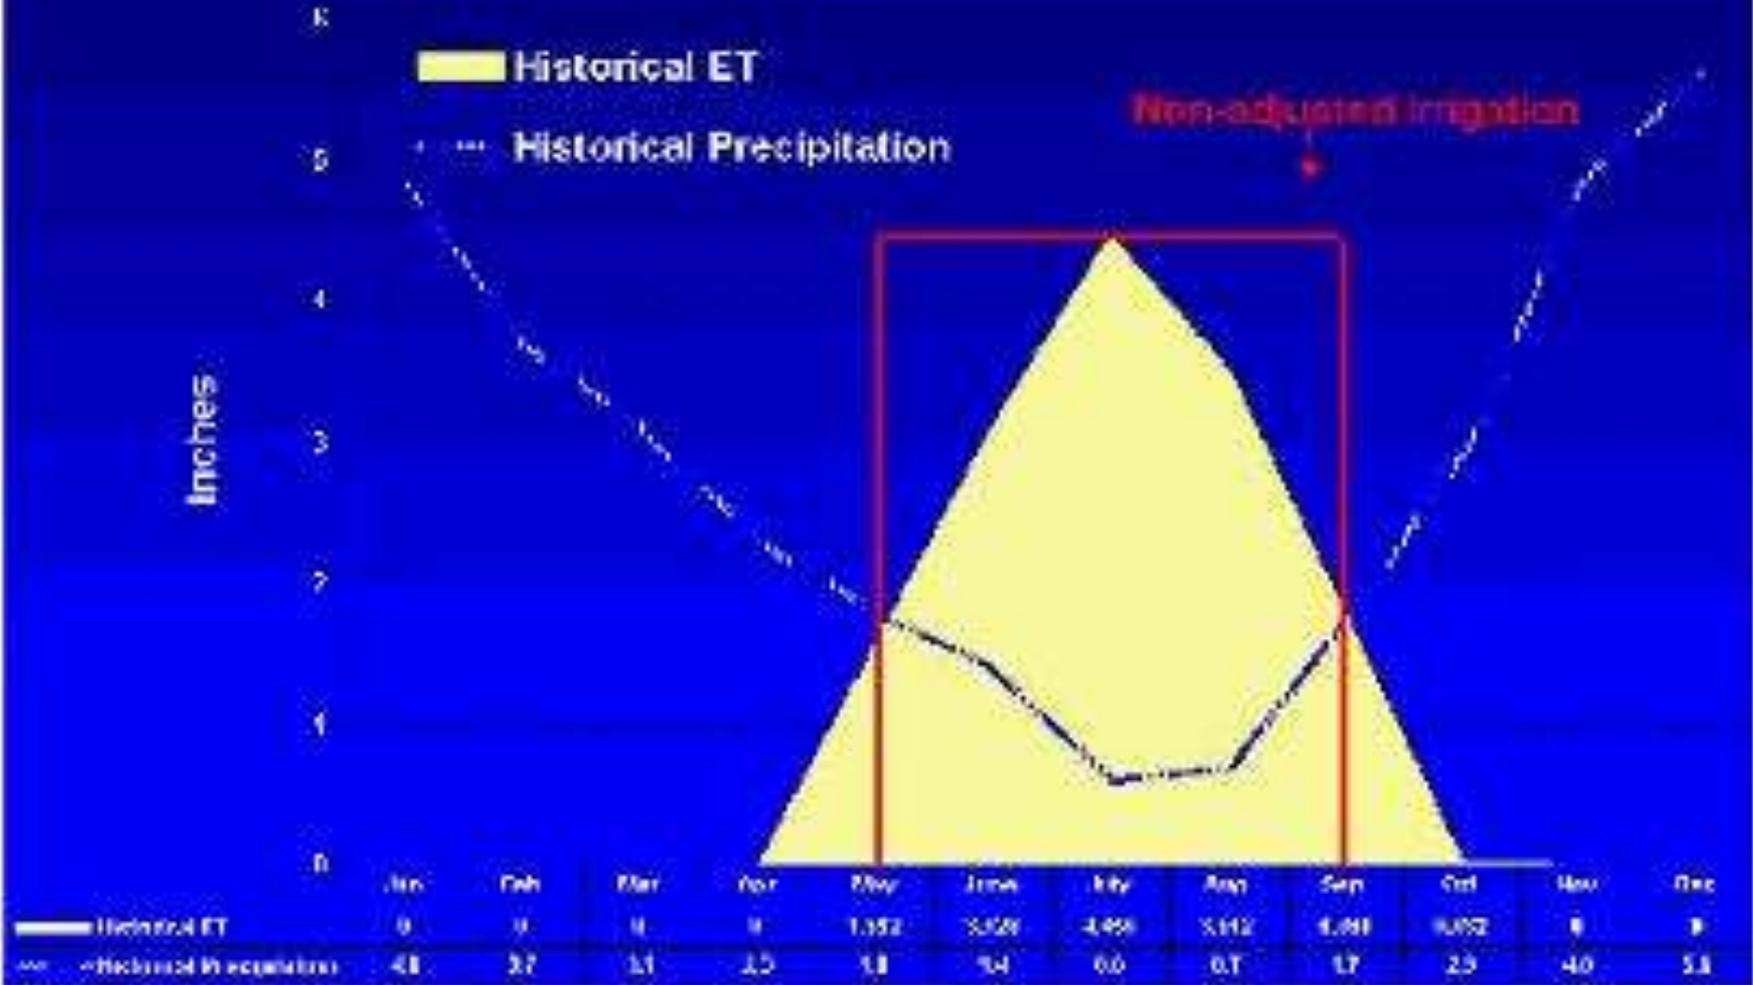

Bottom Line: Evapotranspiration

Step 4: Results

Historical Water Needs and Precipitation

Bottom-line: Irrigation Scheduling

- Guessing
- Standard Schedules
- Audit Schedules
- Fine-tuned

Bottom-line: Irrigation Scheduling

- Guessing – 20 minutes, 5 days per week: 100 minutes
- Standard Schedules – 5 minutes, 2 starts, 4 days: 40 minutes
- Audit Schedules – 4 minutes, 3 starts, 7 days: 84
- Fine-tuned: 3 minutes, 5 starts, 4 days: 60 minutes

Discovery

- There's an opportunity for a service
 - Estimate costs and benefits
- Verify sensors work
- Standard schedules good place to start
 - May need adjustment.
- Auditing provides much more insight
 - Auditing still requires some guesswork
- The environment makes a big difference
 - Fine mulch may create barrier

Step 4: Results

Final Bottom Line

Row Labels	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Grand Total
2011	0	0	0	2	18	2	201	512	729	108	148	0	1720
2012	0	0	0	2	14	349	694	683	484	313	0	0	2539
2013	0	0	2	17	1	338	851	776	463	0	0	0	2448
2014	0	1	0	11	6	425	724	692	314	35	0	0	2208

Final Bottom Line

- Good question!
- Depends on weather
- Based on pre and post schedules
 - about 30% reduction in number of minutes

–Potentially \$3,000 per year

Special thank you to...

- Emma Karlsson, JSH Properties, Sustainability Specialist
- Chad Dreisbach, Landmark Facilities Manager
- Dean Penner, Signature LLC Regional Manager
- JD Wilson, City of Renton
