

CITY OF *Salem*
AT YOUR SERVICE
Public Works Department

Watershed Monitoring in the North Santiam Basin

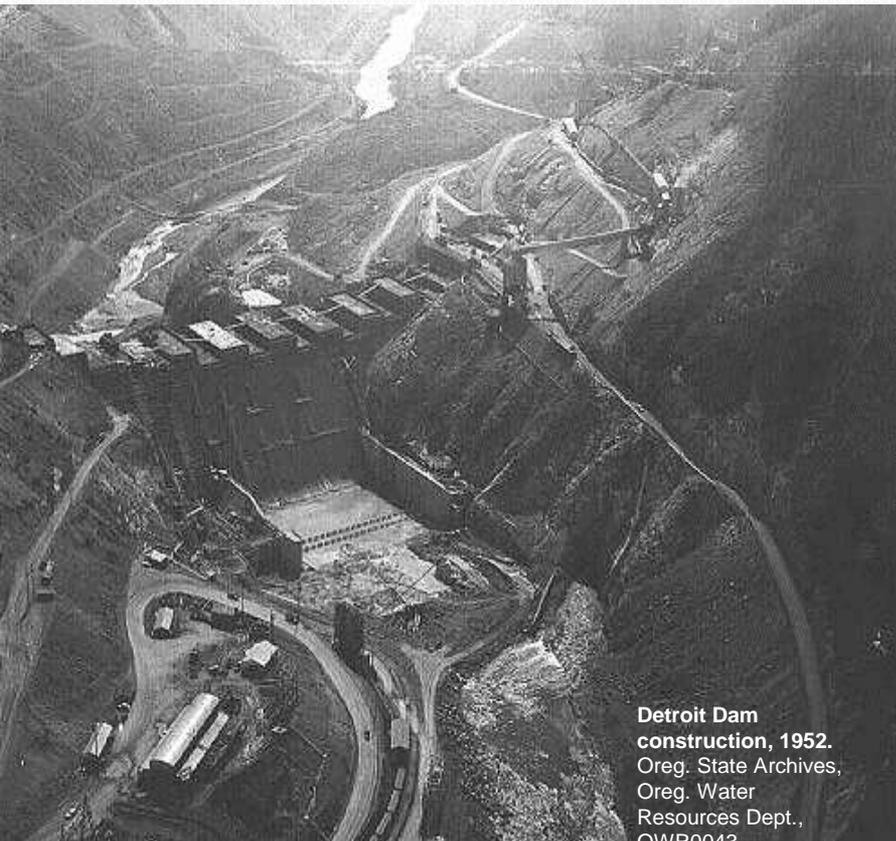

Lacey Goeres-Priest
Water Quality Supervisor

North Santiam Watershed

- Large basin-790 square miles (505,600 acres)
- No City land ownership
- High quality source water
- Dams/reservoirs
- Two-thirds publicly owned

Detroit Dam

Detroit Dam construction, 1952.
Oreg. State Archives,
Oreg. Water Resources Dept.,
QWR0043

**U.S. Army Corps of Engineers
1990**

Completed in 1953; 463 feet tall

Primary purposes – flood control, power generation, water quality improvement, irrigation, fish and wildlife habitat, and recreation

Big Cliff Dam

Completed in 1953; 191 feet tall; regulates Detroit Dam releases

Primary purposes – Flood control, power generation, water quality improvement, irrigation, fish and wildlife habitat, and recreation

PNWS-AWWA Bellevue, WA 2015

Salem's Water System

Water Treatment

1- River Intake

2- Pre-treatment

3- Filtration

4- Disinfection & Fluoridation

5- Corrosion Control

6- Delivery

Watershed Management Issues

- Natural and human-caused hazards

- Erosion

- Hazardous materials

- River dynamics

- Algae

Algae Event 2009

- A large algae event in the upper watershed lead to significant complications at Geren Island
 - Filter blinding in less than 2 days
 - Challenge to process enough water to meet summer demand
- Fear of future events lead to the development of the Watershed Monitoring Program
 - Dedicated staff working on source water protection, water quality and landscape monitoring, and public outreach.
 - Provide water treatment staff with real time observations and data to adaptively manage Geren Island.

Algae Blooms

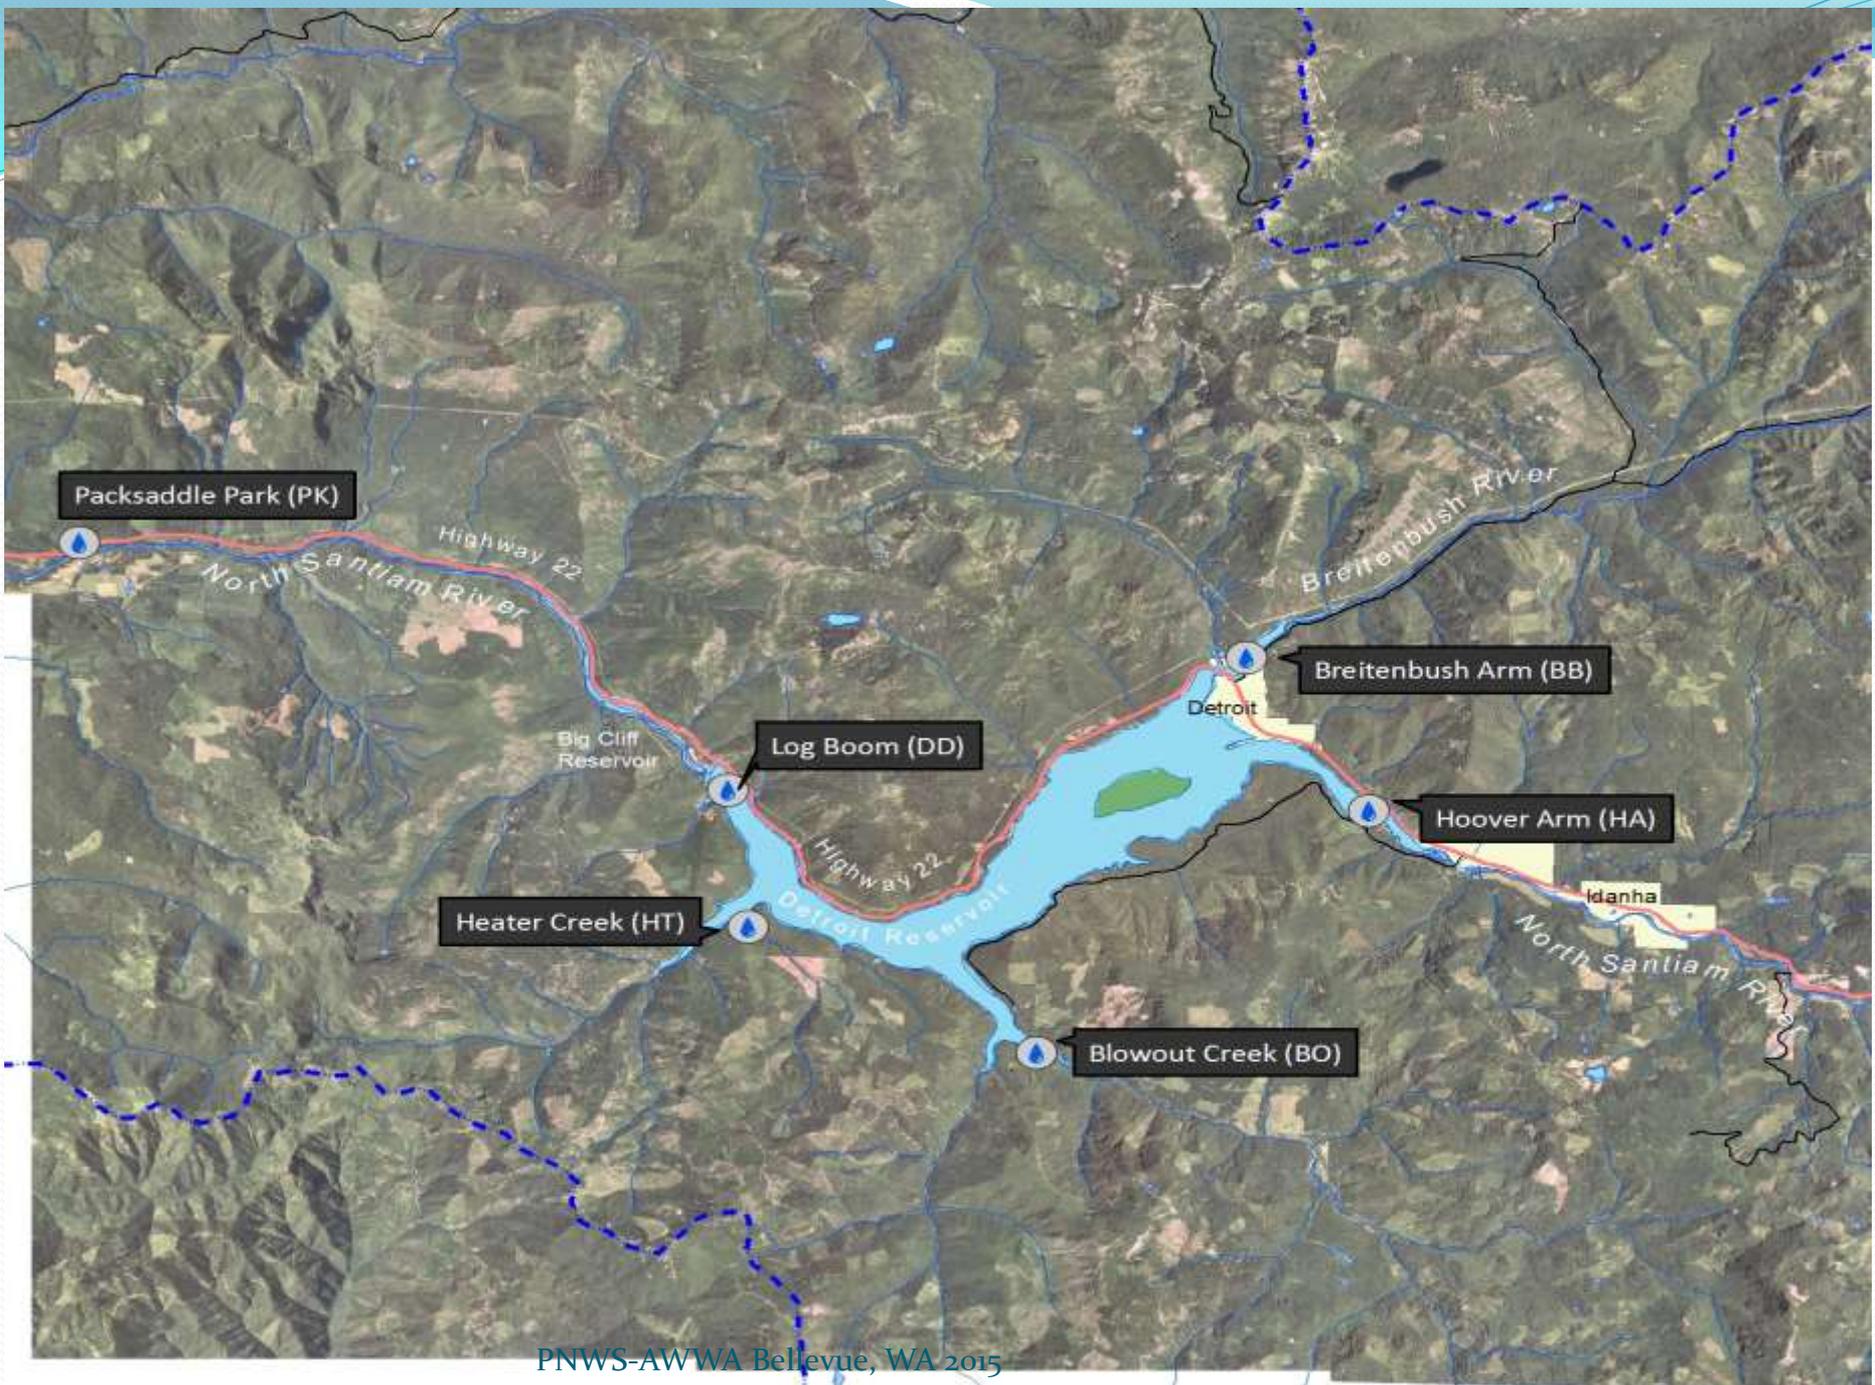

- Not all blooms are toxic, but some have the potential
- City's filter beds effectively remove any toxins that could be present
- Can cause filter-clogging and taste-and-odor issues
- Increases operational demand
- Dam releases potentially influence blooms

A non-toxic green algae bloom slows infiltration rates
PNWS-AWWA Bellevue, WA 2015

A visible algae bloom at Detroit Reservoir during summer 2011

Geren Island Sampling Sites

What data do we collect?

Water Quality

- Nutrients
- pH
- Temperature
- Total Organic Carbon
- Conductivity
- Turbidity
- Dissolved Oxygen
- Algae enumeration and speciation
- Chlorophyll-a
- Phycocyanin
- Silica
- Cyanotoxins
- Water clarity (Secchi depth)
- Visible blooms or scum

Dam Operations -

- Discharge – spill vs power generation
- Reservoir elevation
- Temperature Control Operations

Climate and Stream Flow Conditions

- Annual precipitation and snowpack
- Snow-water equivalent
- Real-time Flow and Discharge Forecast
- Wind direction and speed
- Solar radiation
- Air temperature

Other

- Vehicle Accidents
- Hazardous Materials Spills
- Construction Activities
- Timber Sales

Program Components (Oct – April)

Weekly Sampling at Geren Island

Physical Parameters

Algae ID and #

Nutrients

Monthly River Sampling

All of the above

Toxin samples from PK and MI

Monthly Visual Assessment at Detroit and Big Cliff

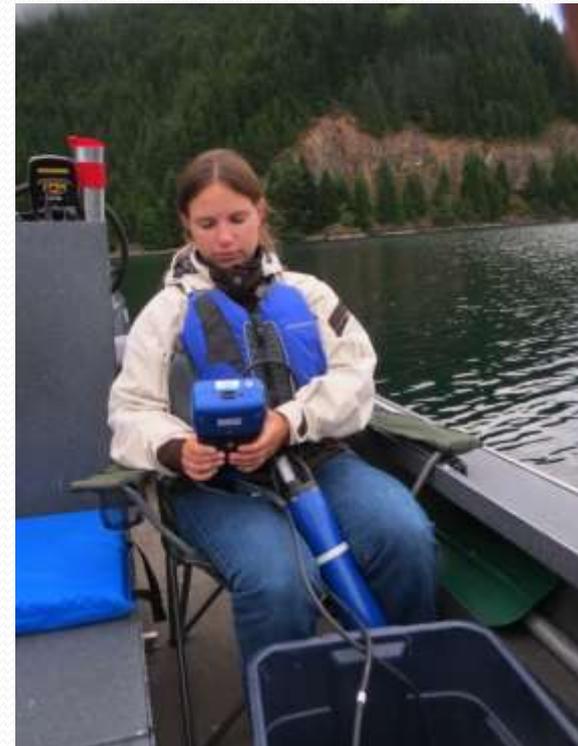

Program Components (May – Oct)

- Weekly Sampling at Detroit Reservoir
 - Intensive sampling at all sites once per month
 - Physical Parameters
 - Algae ID and #
 - Nutrients (including NH_4)
 - Silica
 - Toxins, if conditions warrant
 - Field Observations (wind, temp, etc)

Program Components (May – Oct)

- Weekly Sampling at Detroit Reservoir
 - Routine Sampling at Log Boom and Heater Creek
 - Physical Parameters
 - Algae ID and #
 - Nutrients
 - Toxins, if conditions warrant
 - Field Observations (wind, temp, etc)
 - Visual Assessments at Remaining Sites
 - Collect Samples if Necessary

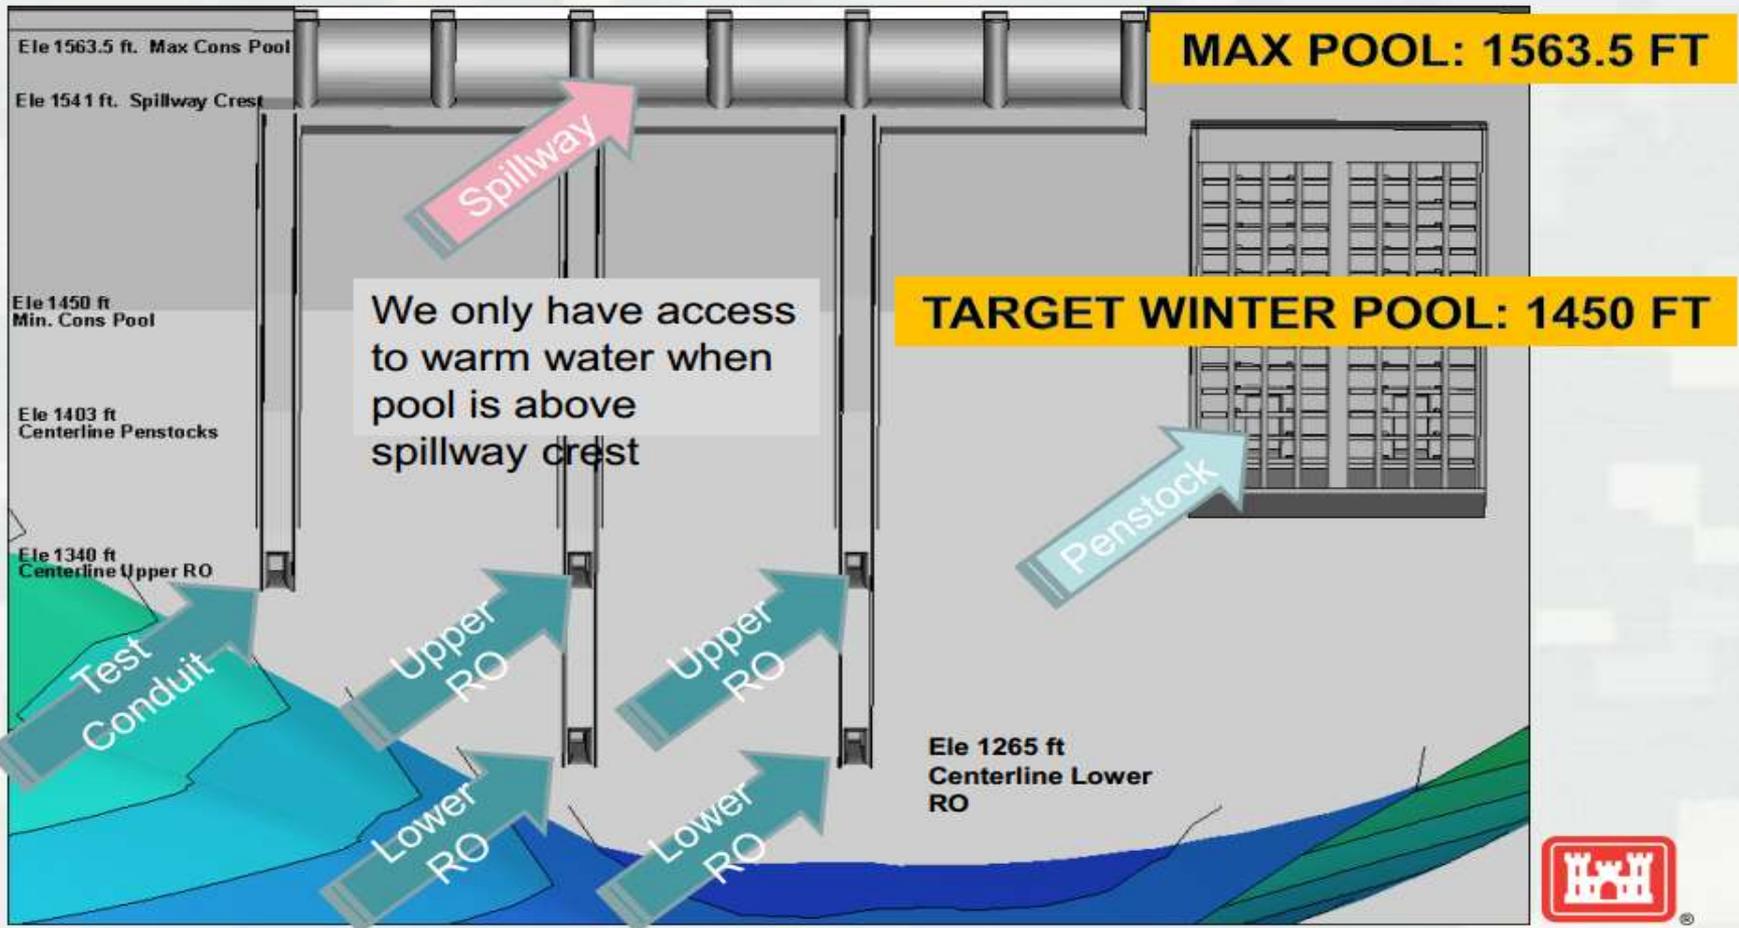

Sampling at Log Boom

- If Lake Elevation > 1561'
 - Surface Sample
 - Sample from Spill Depth
 - Sample from Power Depth
 - Sample from Highest BGA/CHLOR RFU
- If Lake Elevation < 1561'
 - Surface Sample
 - Sample from Power Depth
 - Power from Regulating Outlet Depth
 - Sample From Highest BGA/CHLOR RFU

Existing Project: Upstream Face

Program Components (May – Oct)

- Weekly Sampling – N. Santiam River
 - Routine Sampling at Packsaddle Park
 - Physical Parameters
 - Algae ID and #
 - Nutrients
 - Toxins, if conditions warrant

Watershed Monitoring – Summer 2014

- First Detect: May 29
 - Log Boom: 0.6 $\mu\text{g/L}$
 - Heater Creek: 64.4 $\mu\text{g/L}$
 - Blowout Creek: 195 $\mu\text{g/L}$ *

* Blowout Creek sample concentration was not QA/QC by the lab.

Tim Sherman, operations and maintenance supervisor, collects water from a sample point at the Green Island Water Treatment Facility in Dayton on Thursday. (Associated Press/Chris Wedel)

Small amount of toxin found in water supply

Extra filtering steps added until the toxin disappears

By Michael Rose
Statesman Journal

Salen has added extra treatment steps to its municipal water system after a toxin produced by an algae bloom was detected in samples drawn from the North Linneman River, the city's primary source of water.

The toxin, cylindrospermopsin, was found at "barely measurable levels" in untreated river water on Aug. 1, said Francis Renke, operations division manager for the city's public works department.

None of the toxin has been found in Salen's finished drinking water, Renke said. The extra water treatment processes — an additional filtering step — will continue until no trace of cylindrospermopsin is found in river water, he said.

Peter Fernandez, Salen's public works director, said the city hasn't had serious problems with algae blooms.

"When we see things like this (a concentration), we have to be very cautious because the toxin is

WATER WORRIES

The problem: Cylindrospermopsin, a toxin produced by algae, has been found in the North Linneman River but not in Salen's tap water.

The response: Instead of using water straight from the river, the city is pumping water from wells and pushing it through two filtration systems before sending it to the

Coltrane named interim president of UO

Gottfredson is granted \$940,000 in severance pay

By Hannah Hoffman
Statesman Journal

The University of Oregon Board of Trustees appointed provost Scott Coltrane interim president Thursday afternoon, one day after President Michael Gottfredson announced he would resign after two years in the position.

Gottfredson gave no reason for stepping down other than a desire to spend more time with his family, and his departure was effective almost immediately. He had served two of the three years guaranteed in his contract. The board unanimously approved a negotiated separation agreement with Gottfredson, giving him a \$940,000 severance.

Gottfredson assured the university trustees greater greater independence, helping push the Oregon Legislature last year for an institutional governing board. However, his relationship with faculty, students and alumni was rocky, and the university faced questions over his leadership about a possible cover-up of alleged sexual assaults by three members of the men's basketball team.

The 15-member board, which assumed power July 1, accepted his resignation Thursday afternoon.

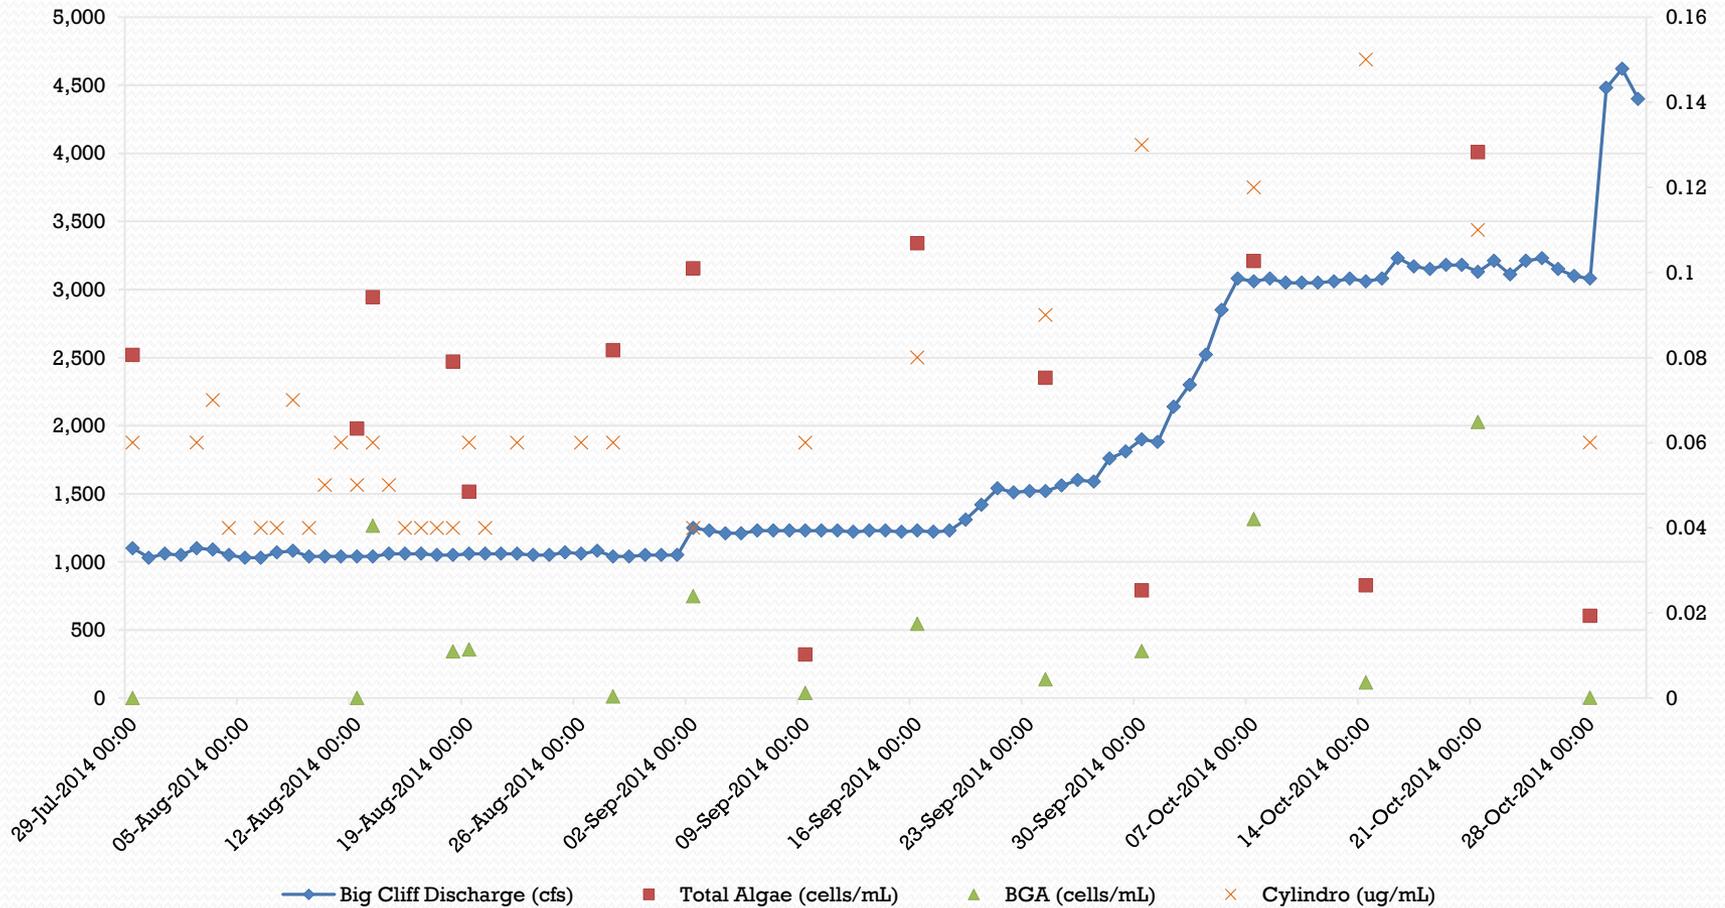

Neither Gottfredson nor board chairman Chuck Latta cited a specific reason for his departure. However, his tenure was peppered with struggles and problems.

The most public of them has been the sexual assault allegations. The men accused were dismissed from the basketball

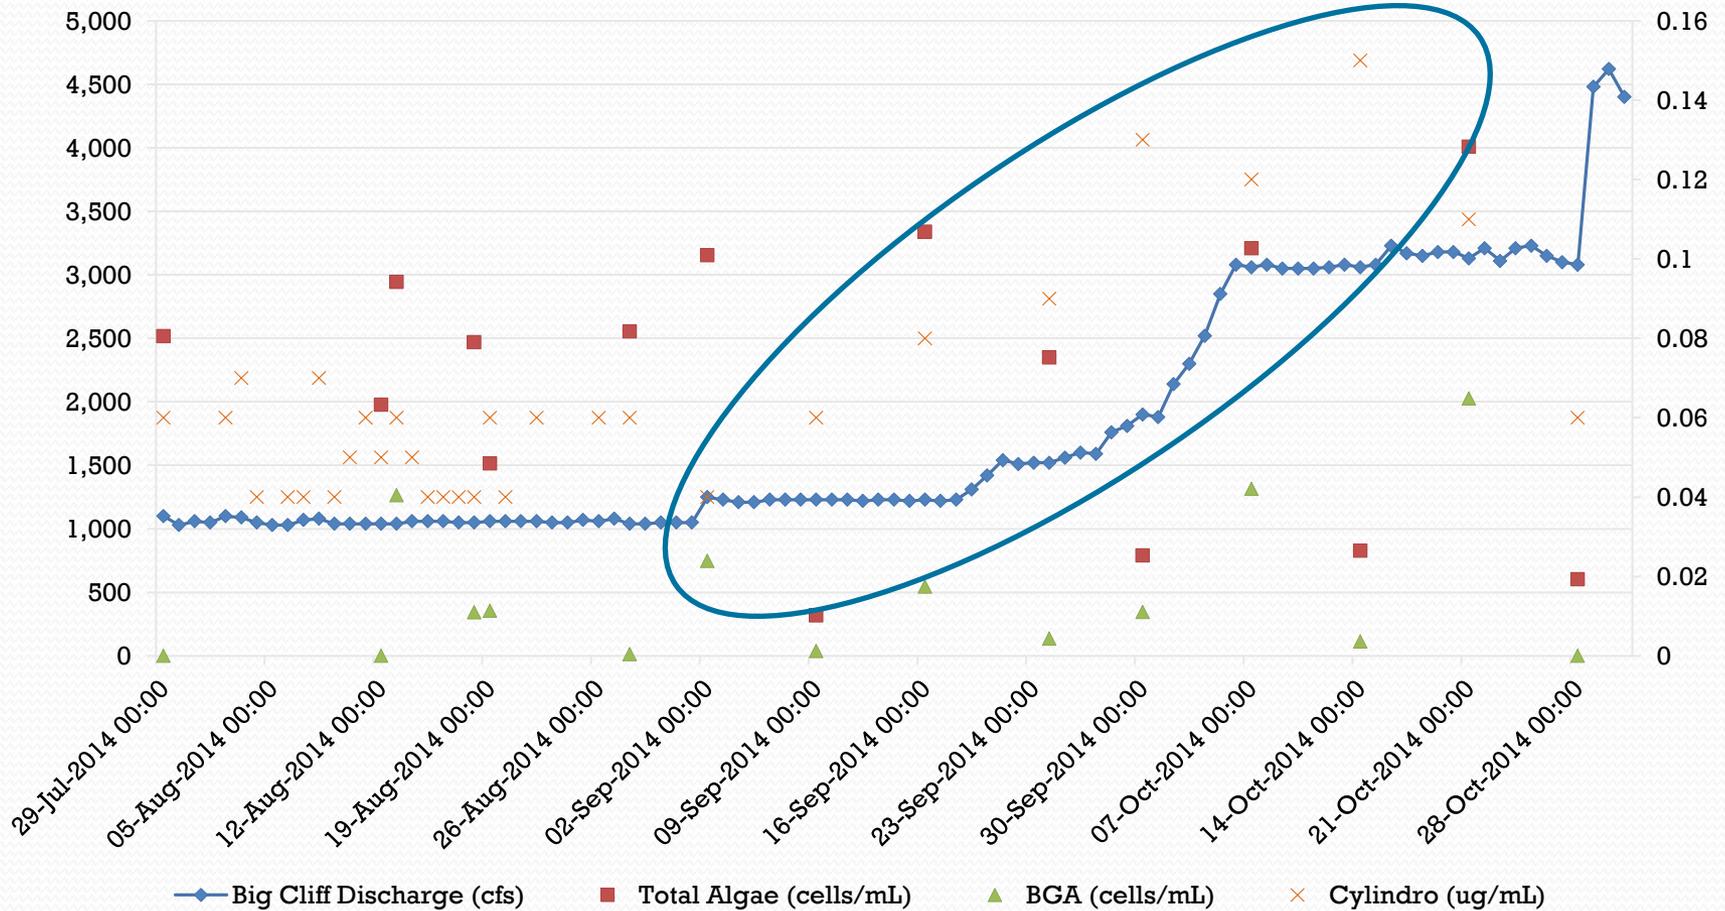

Public Outreach

- Share testing results with the community following Toledo, OH incident
- Build confidence that the City is committed to monitoring and providing safe, high quality drinking water
- Generated little interest from the public

Summer 2014

Summer 2014

Summer 2014 Recap

- Toxin results in river likely from bloom in May/June
- No silver bullet to model for algae population dynamics
- Continue to try to identify predictors for samples that are sent to external labs (examine data from 2011-13)
