

Monitoring SUEZ Production Well Performance

2016 AWWA PNWS Conference

Roger Dittus P.G.

May 6, 2016

Well efficiency decline is obviously a bad thing...

Increased pump lift

Pump design becomes “wrong”

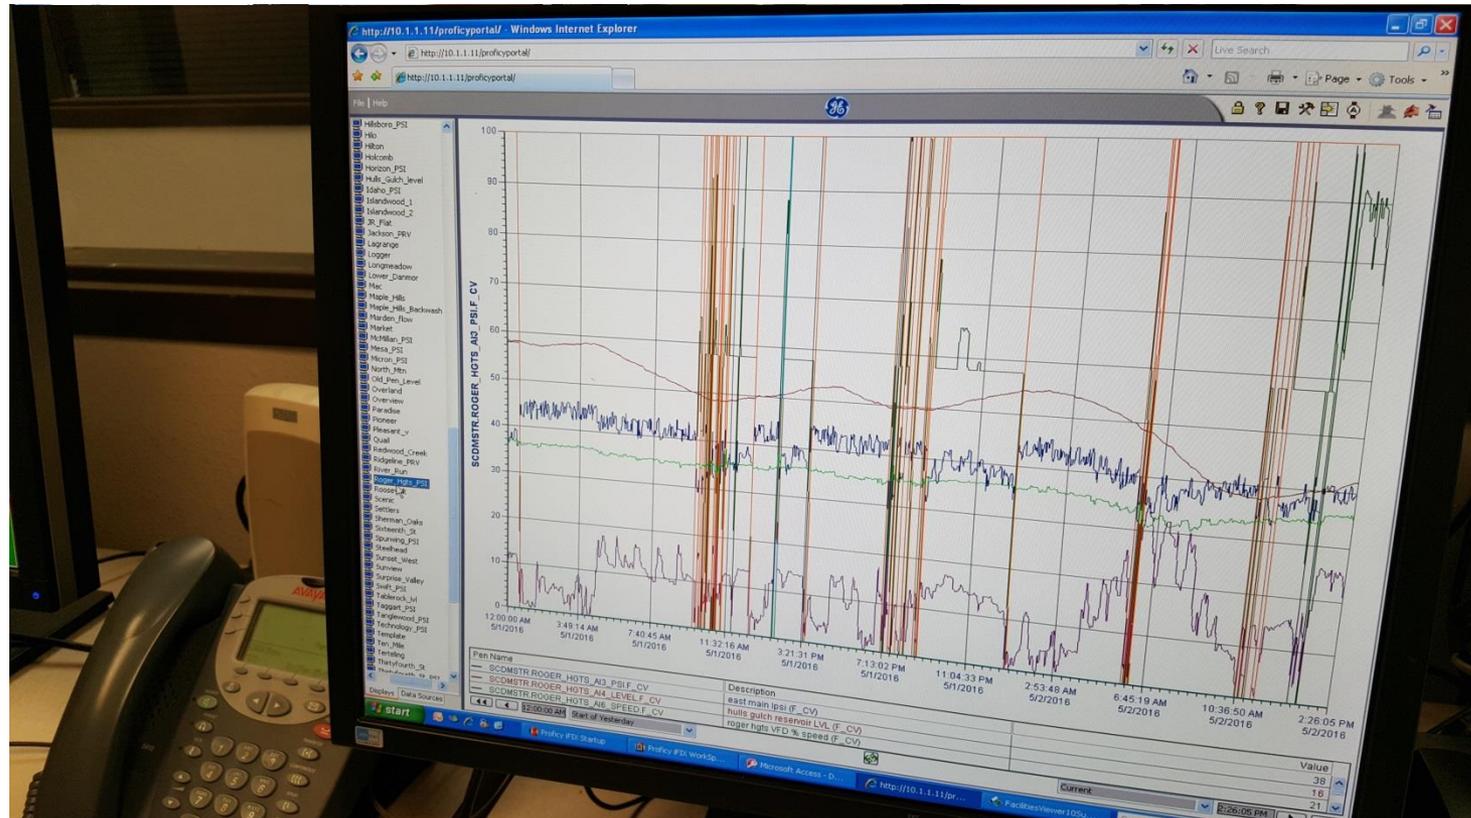

wasted energy

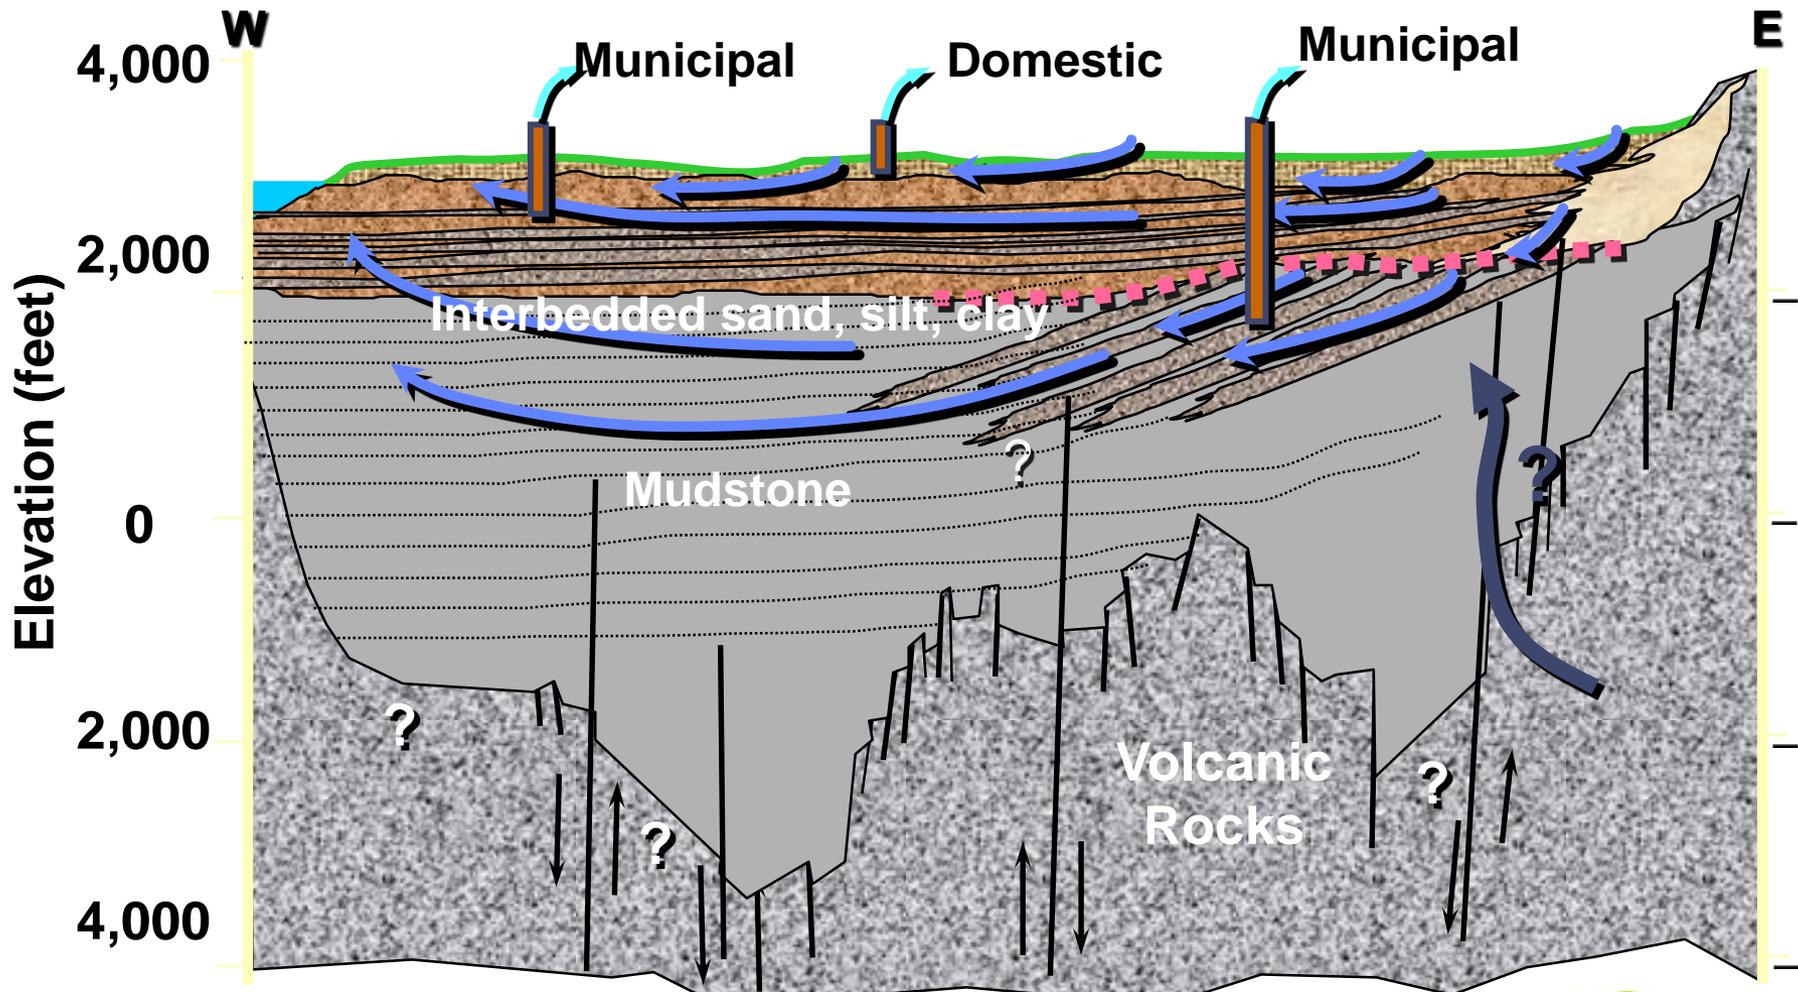

lowered ability to meet demand

may become “permanent”

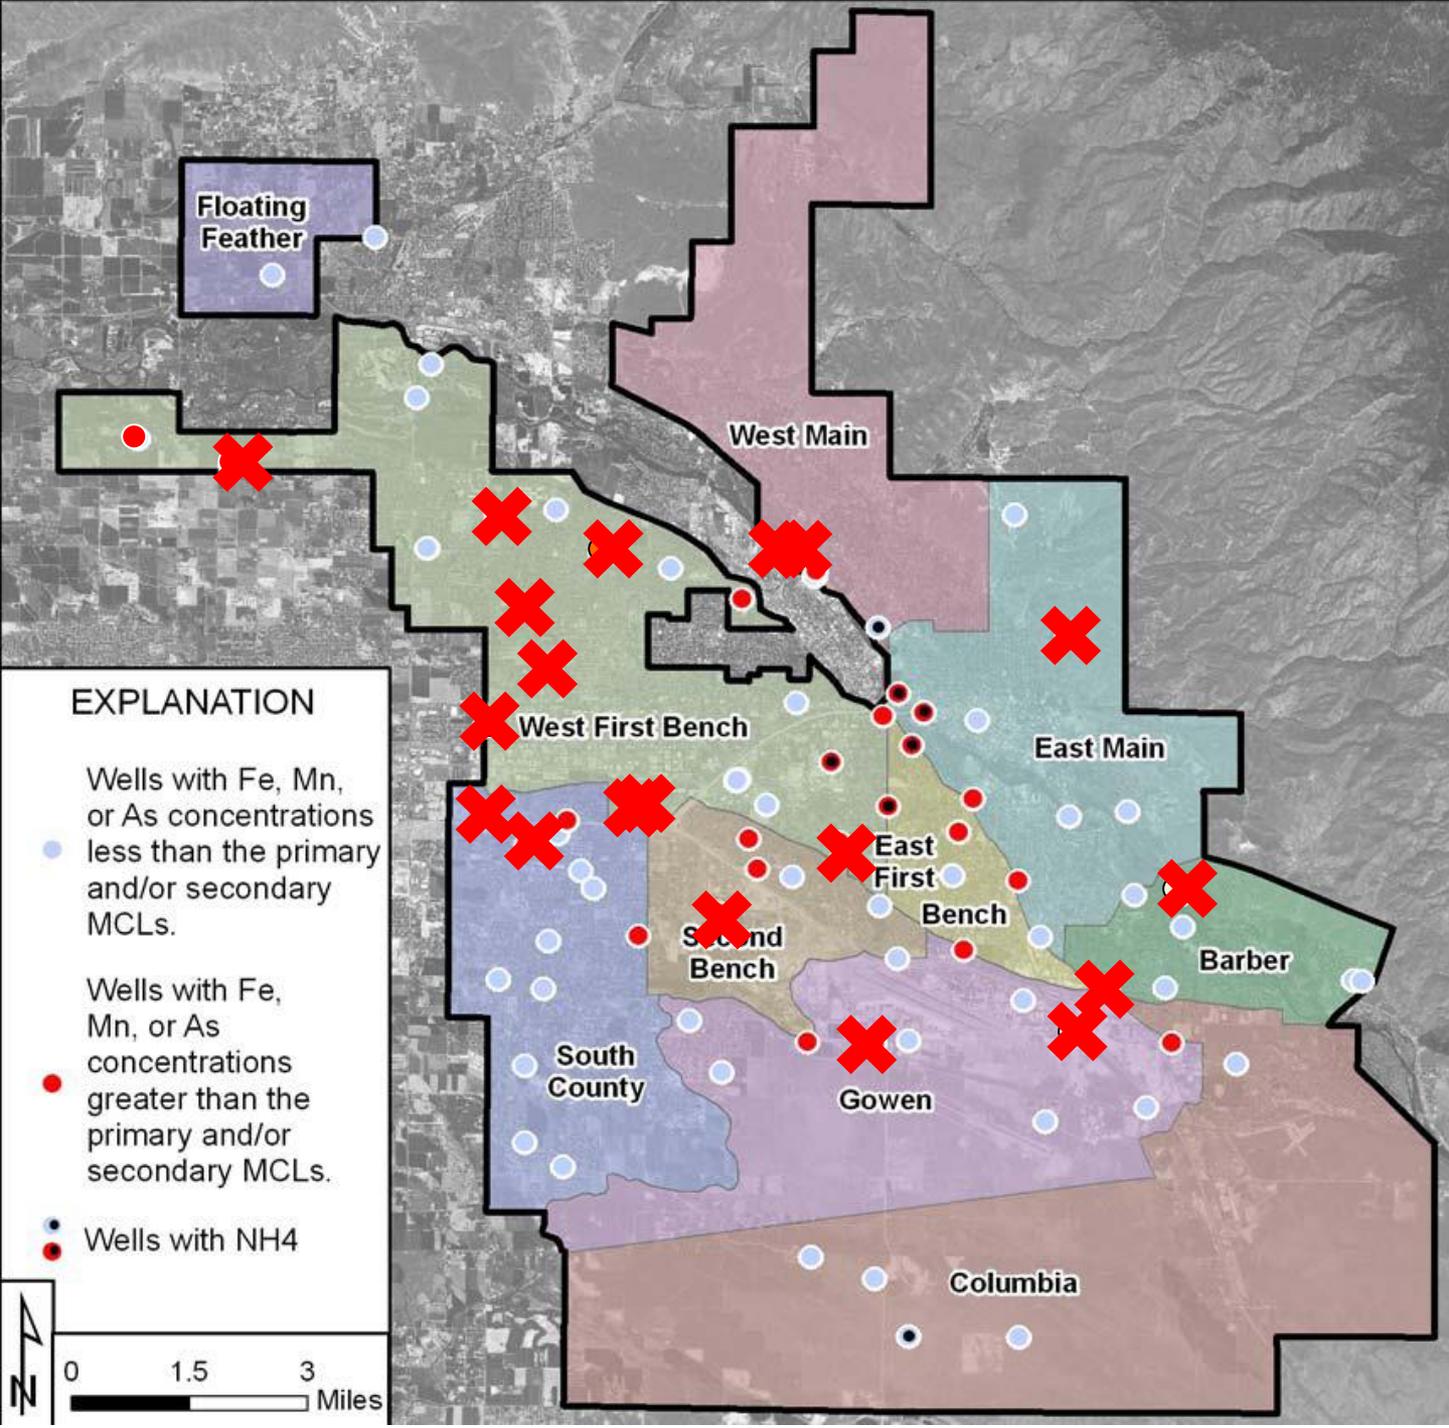

Monitoring well performance

Conceptual Cross-Section (Regional Scale)

Adapted from a cross section by S. Wood BSU Geosciences

Concentration
> Primary MCL

● Uranium

○ Arsenic

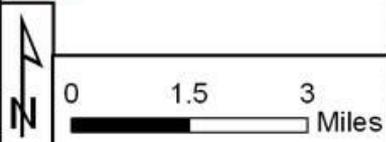

✗ = "not useful"

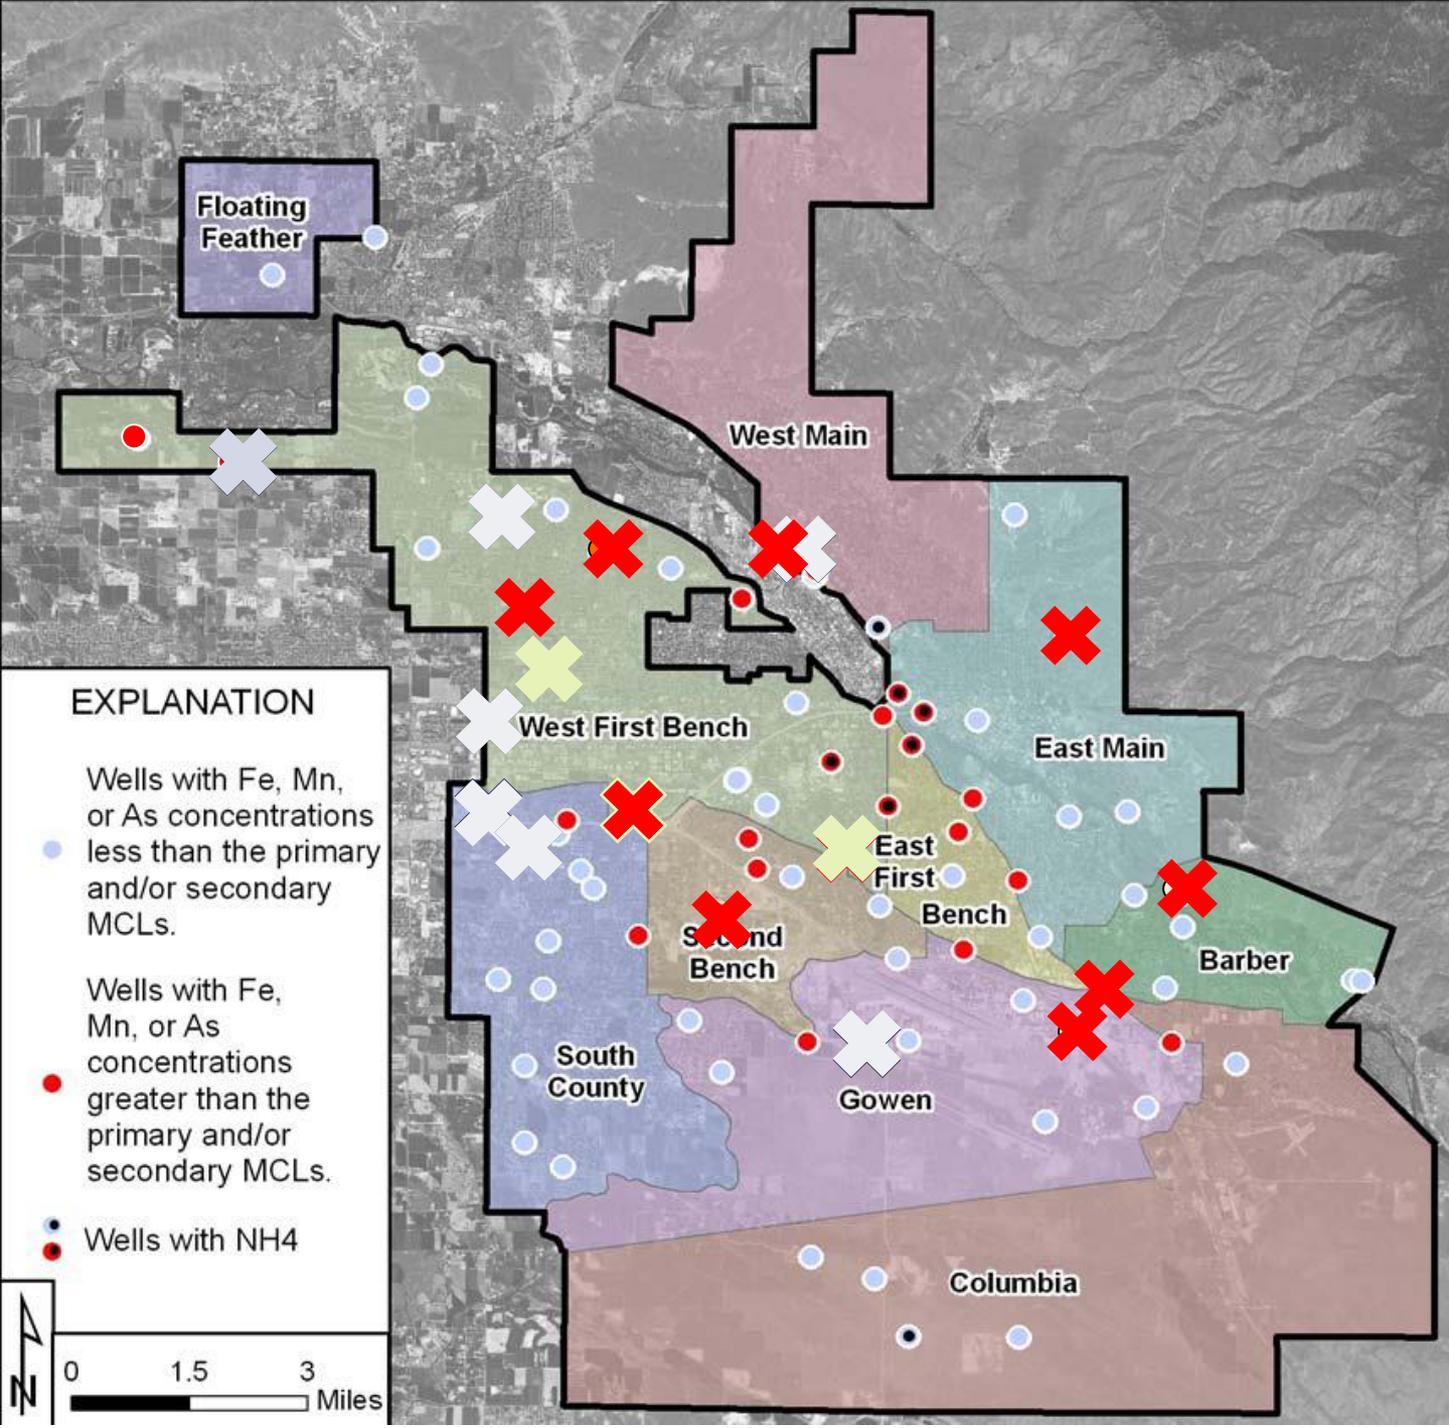

EXPLANATION

Wells with Fe, Mn, or As concentrations less than the primary and/or secondary MCLs.

Wells with Fe, Mn, or As concentrations greater than the primary and/or secondary MCLs.

● Wells with NH4

EXPLANATION

Wells with Fe, Mn, or As concentrations less than the primary and/or secondary MCLs.

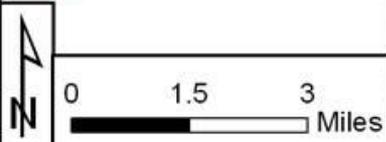

Wells with Fe, Mn, or As concentrations greater than the primary and/or secondary MCLs.

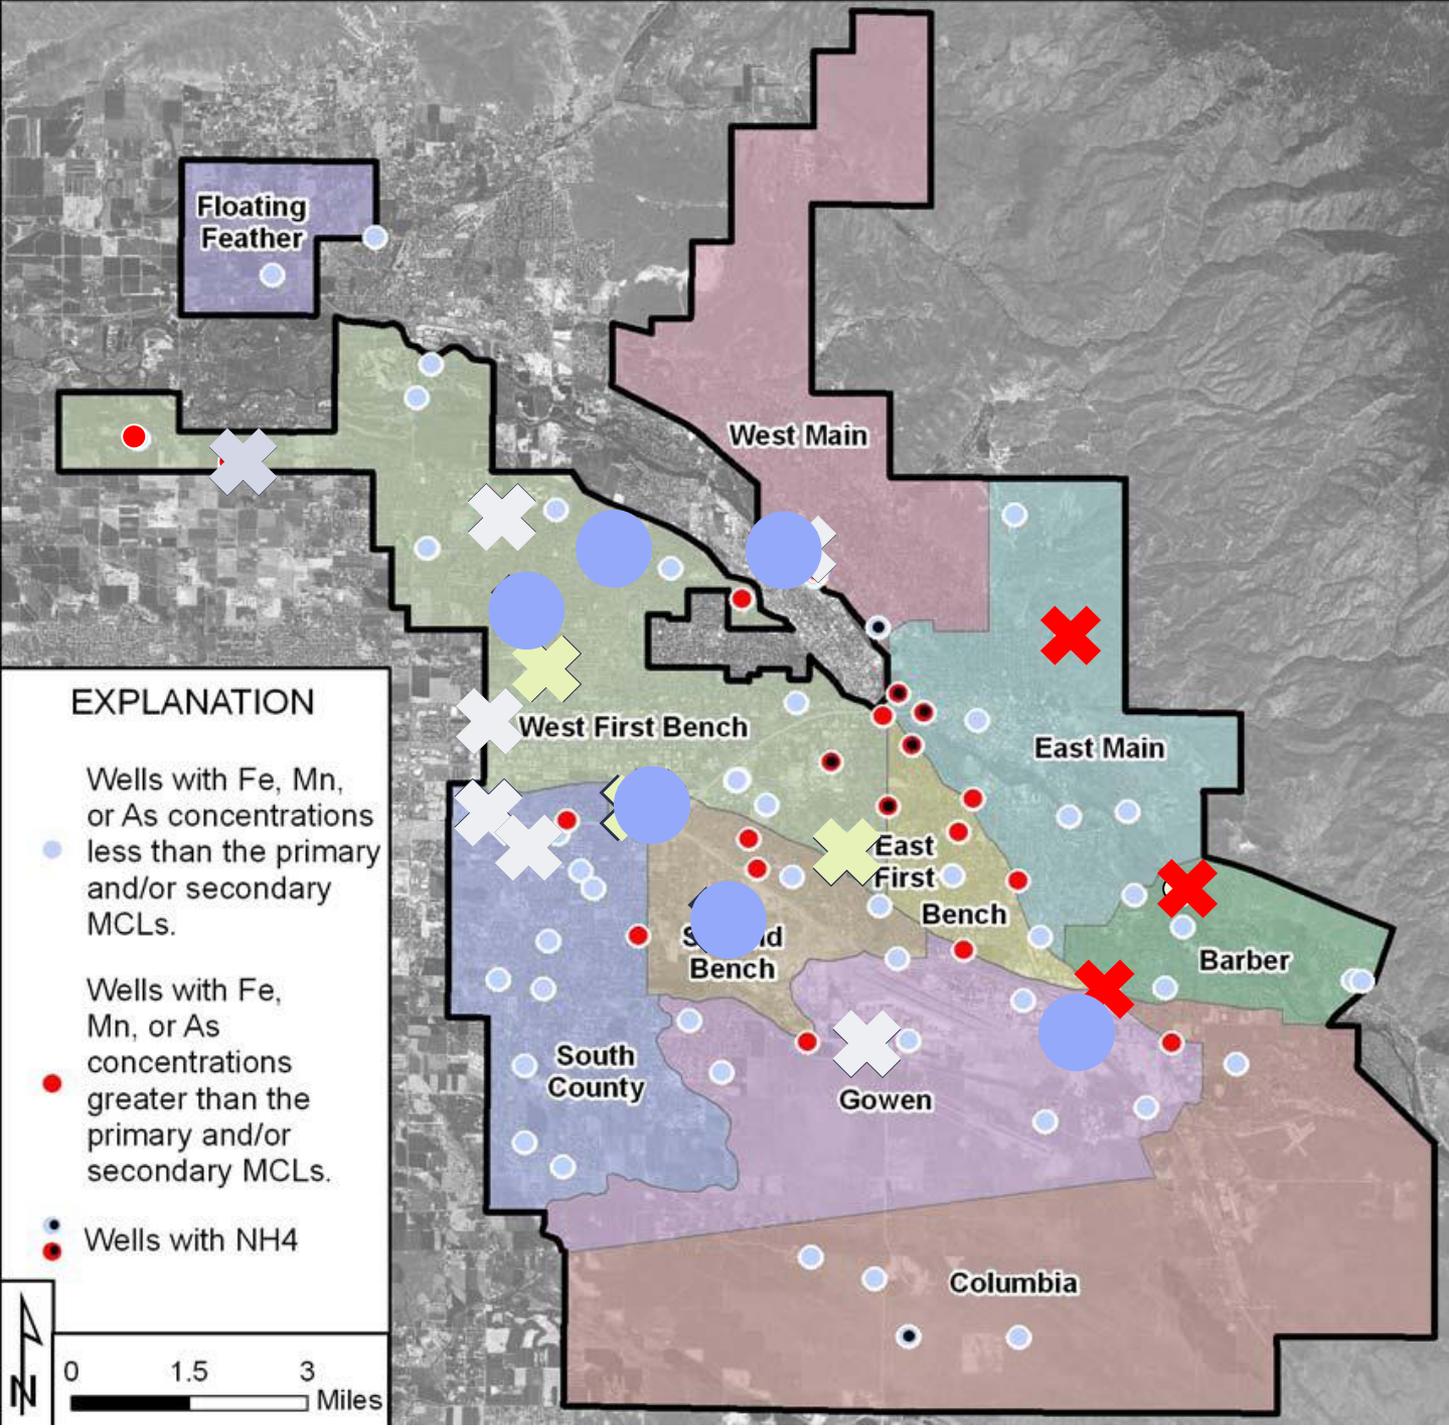

Wells with NH4

-  Decommission
-  Treat Fe/Mn
-  Re-drill

EXPLANATION

Wells with Fe, Mn, or As concentrations less than the primary and/or secondary MCLs.

Wells with Fe, Mn, or As concentrations greater than the primary and/or secondary MCLs.

Wells with NH4

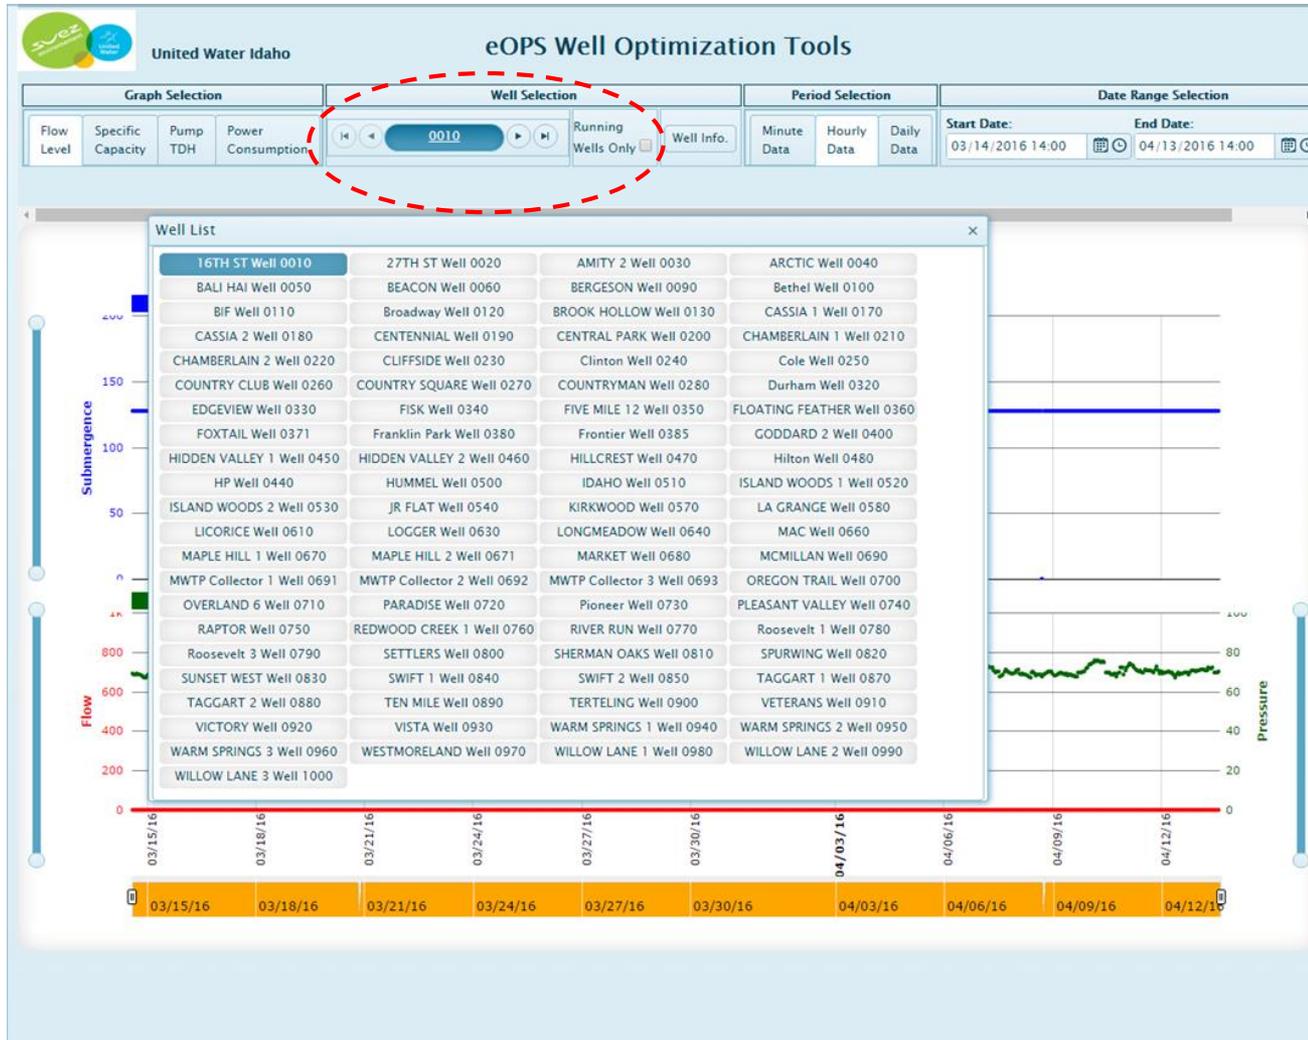

-  Decommission
-  Treat Fe/Mn
-  Re-drill
-  ASR

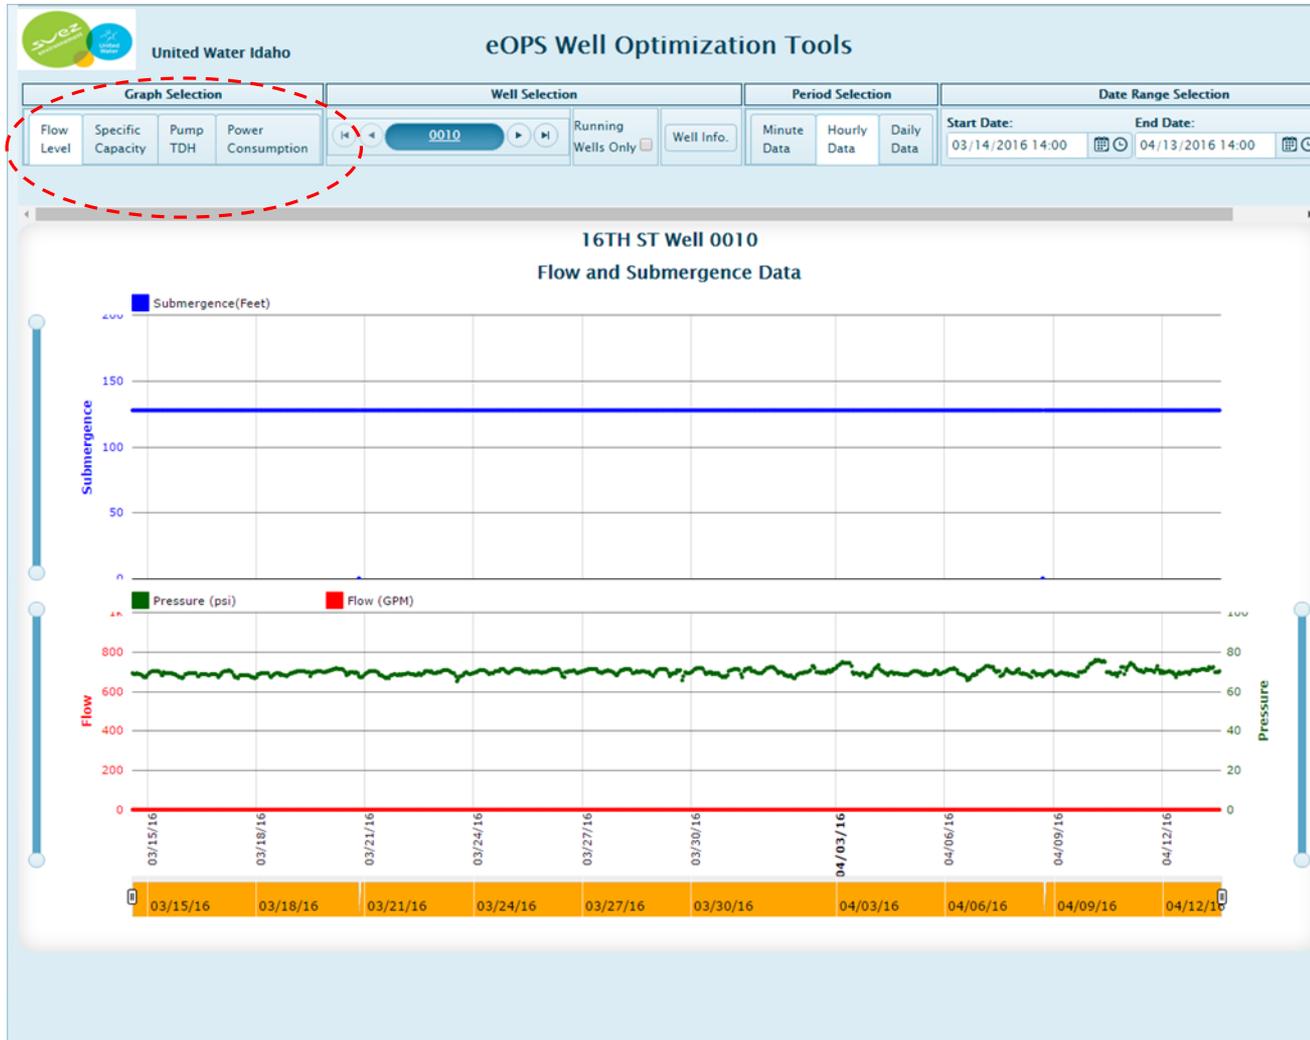

SUEZ “Well Op” tool helps us evaluate well performance

- SUEZ utility in New York modeled Well Op tool on original version of “Well Watch” software developed under SUEZ R + i Alliance
- Well Op tool creates easily scalable graphs of SCADA system data
- Allows comparison of current/ recent well performance to previous performance

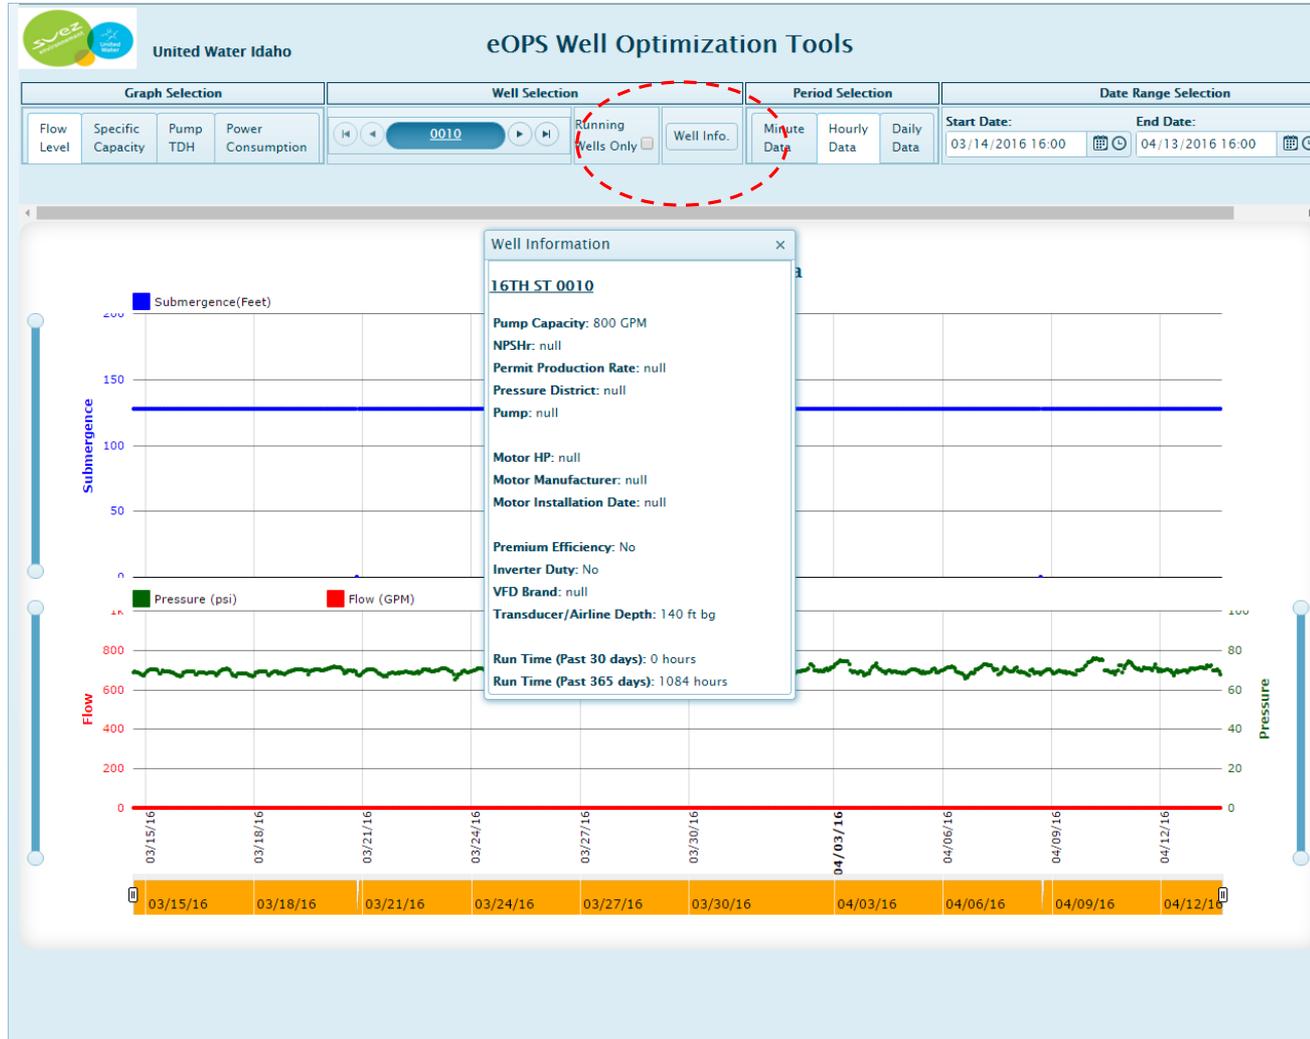

Well Op tool

Another example

Summary

- Well Op tool allows for an easy comparison of current to historic well performance
- Can be more confident of need to perform well, pump, and monitoring equipment maintenance
- Currently working to translate observations from Well Op Tool into work orders in GIS-based asset management system
- In a nut shell: Current tool use = we look for a problem to fix

Always room for improvement

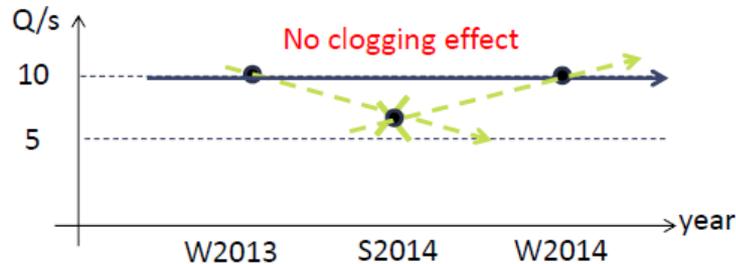

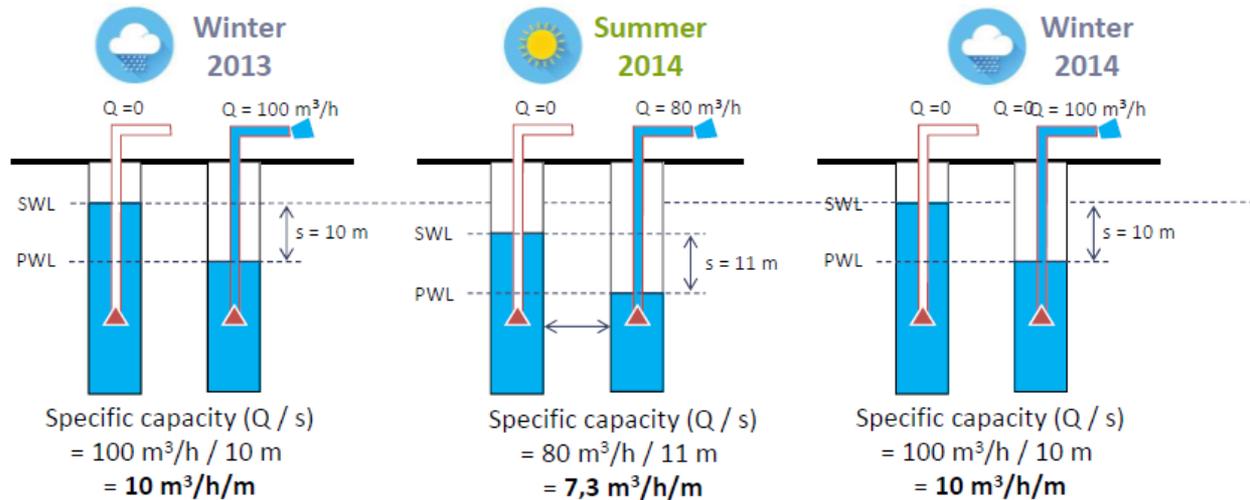

More advanced tool will be available soon

More advanced tool will be available soon

> Focus on « Smart filter » button

If you look Q/s evolution between W2013 and S2014, you can think that a clogging effect appeared, but in fact, this evolution is linked with a low SWL (summer).

SMART FILTER permit to compare Q/s point with the same SWL > in that case, you can compare Q/s point

Thank you
